1 Background

The European Transport Solver (ETS) is a new 1d core transport codes being developed by members of Integrated Modelling Project 3 ("Transport Code and Discharge Evolution") of the EFDA Task Force on Integrated Tokamak Modelling (ITM). The approach taken by the ITM is to couple codes so that the only exchange is via well specified data structures (CPOs, Consistent Physical Objects), with the aim of having the workflow managed by Kepler, a Scientific Workflow engine.

Thus the work of the ETS group is both to prepare the core 1d transport solver, and, in conjunction with other parts of the ITM, to prepare workflows using the ETS.

The ITM has defined the CPO definitions for the physics inputs and outputs for a number of physics areas. Those relevant for the ETS include: (a) equilibrium, (b) core sources, (c) core transport, (d) core profile, (e) neoclassical transport, and (f) core impurities.

The current version of the core ETS code expects to receive as input: (a) equilibrium CPOs representing the equilibrium at the previous time-step, and at the present iteration (b) core source and transport CPOs representing the sources of current, particles, momentum and electron and ion energies, as well as the transport coefficients of these quantities represented as diffusion coefficients and convective velocities at the present iteration, (c) the plasma state as represented by the core profile at the previous time step and the previous iteration. It then returns an updated plasma state in a new core profile.

In addition to the core ETS routine, the ETS group within IMP3 has also prepared a number of workflows represented by code wrappers (these will ultimately be converted to Kepler workflows).

The first of these encompasses an analytical test case where the method of manufactured solutions is used to prepare an analytical solution to the test problem which can then be compared to the numerical solution. The test case incorporates a time varying problem with coupled poloidal flux, ion density, toroidal velocity and electron and ion temperature equations.

The second workflow takes sources and transport coefficients from a previously saved case in the ITM data-base, and then solves for the poloidal flux, density, velocity and temperatures including self-consistent calculations of the equilibrium (or with a "cylindrical" equilibrium). For these cases, the results are compared with the results from the ASTRA 1d core transport code (or with analytical results).

One of the features of the ETS is that internally there is a separation of the physics and the numerics. All of the equations are cast in the same form characterized by a number of vectors of coefficients, and these are then passed to one of the implemented solvers.

2 Analytical comparisons

Two versions of the work-flow calling the ETS are used.

The first, `solver_test`, uses the method of manufactured solutions to provide analytical results against which the numerical solutions can be compared.

The second, `eq_ets_test`, obtains sources and transport coefficients by reading from a specified shot/run. The equilibrium is either cylindriaol read the same way, or obtained from an equilibrium solver (EMEQ).

A number of solvers are implemented in the ETS:

solver 1 "standard" RITM

solver 2 "integral" RITM

solver 3 "PROGONKA" (block Thomas)

solver 6 Huysmans' solver

solver 7 RITM differential solver ???

solver 10 COS solver

2.1 Behaviour as a function of δx for `solver_test`

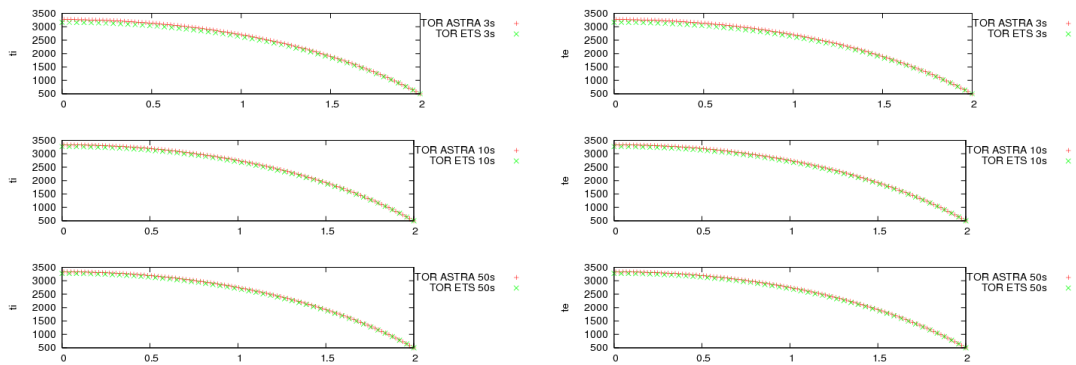

Figure 40: Comparison of ion and electron temperatures at 3, 10 and 50s.

Figure 41: Comparison of ψ , total current and q at 3, 10 and 50s.

5 Equilibrium code comparisons

Figure 42: From left to right, BDSEQ, HELENA, EMEQ. From top to bottom, central pressures of 5, 50, 500 and 5000.

Figure 43: Relative Shafranov shifts.

6 Convergence studies with HELENA

6.1 Standalone HELENA

These studies were done with the end state of a calculation of the ETS coupled to HELENA. The number of radial point (NR) and poloidal points (NP) in helena were varied and the results compared.

The results for key quantities are shown in figures [44](#), [45](#), [46](#), [47](#) and [48](#).

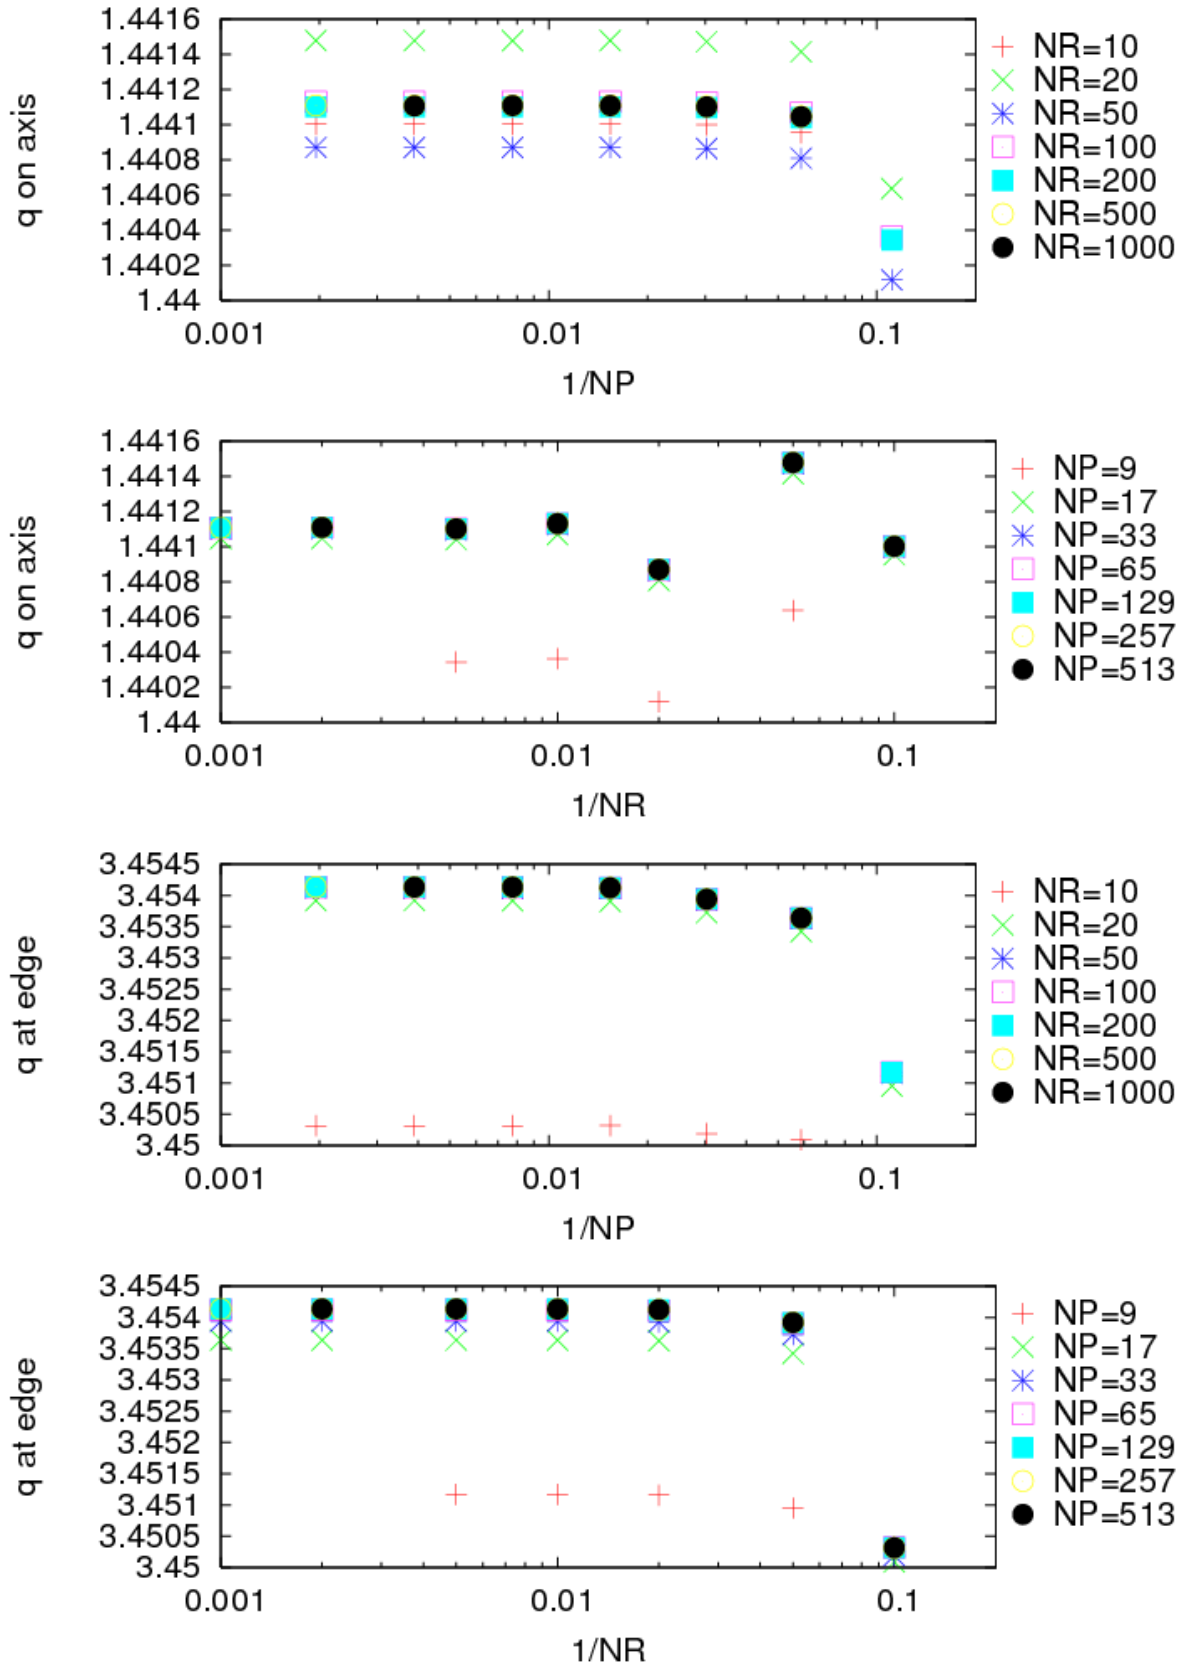

Figure 44: Convergence of q .

Figure 45: Convergence of V'

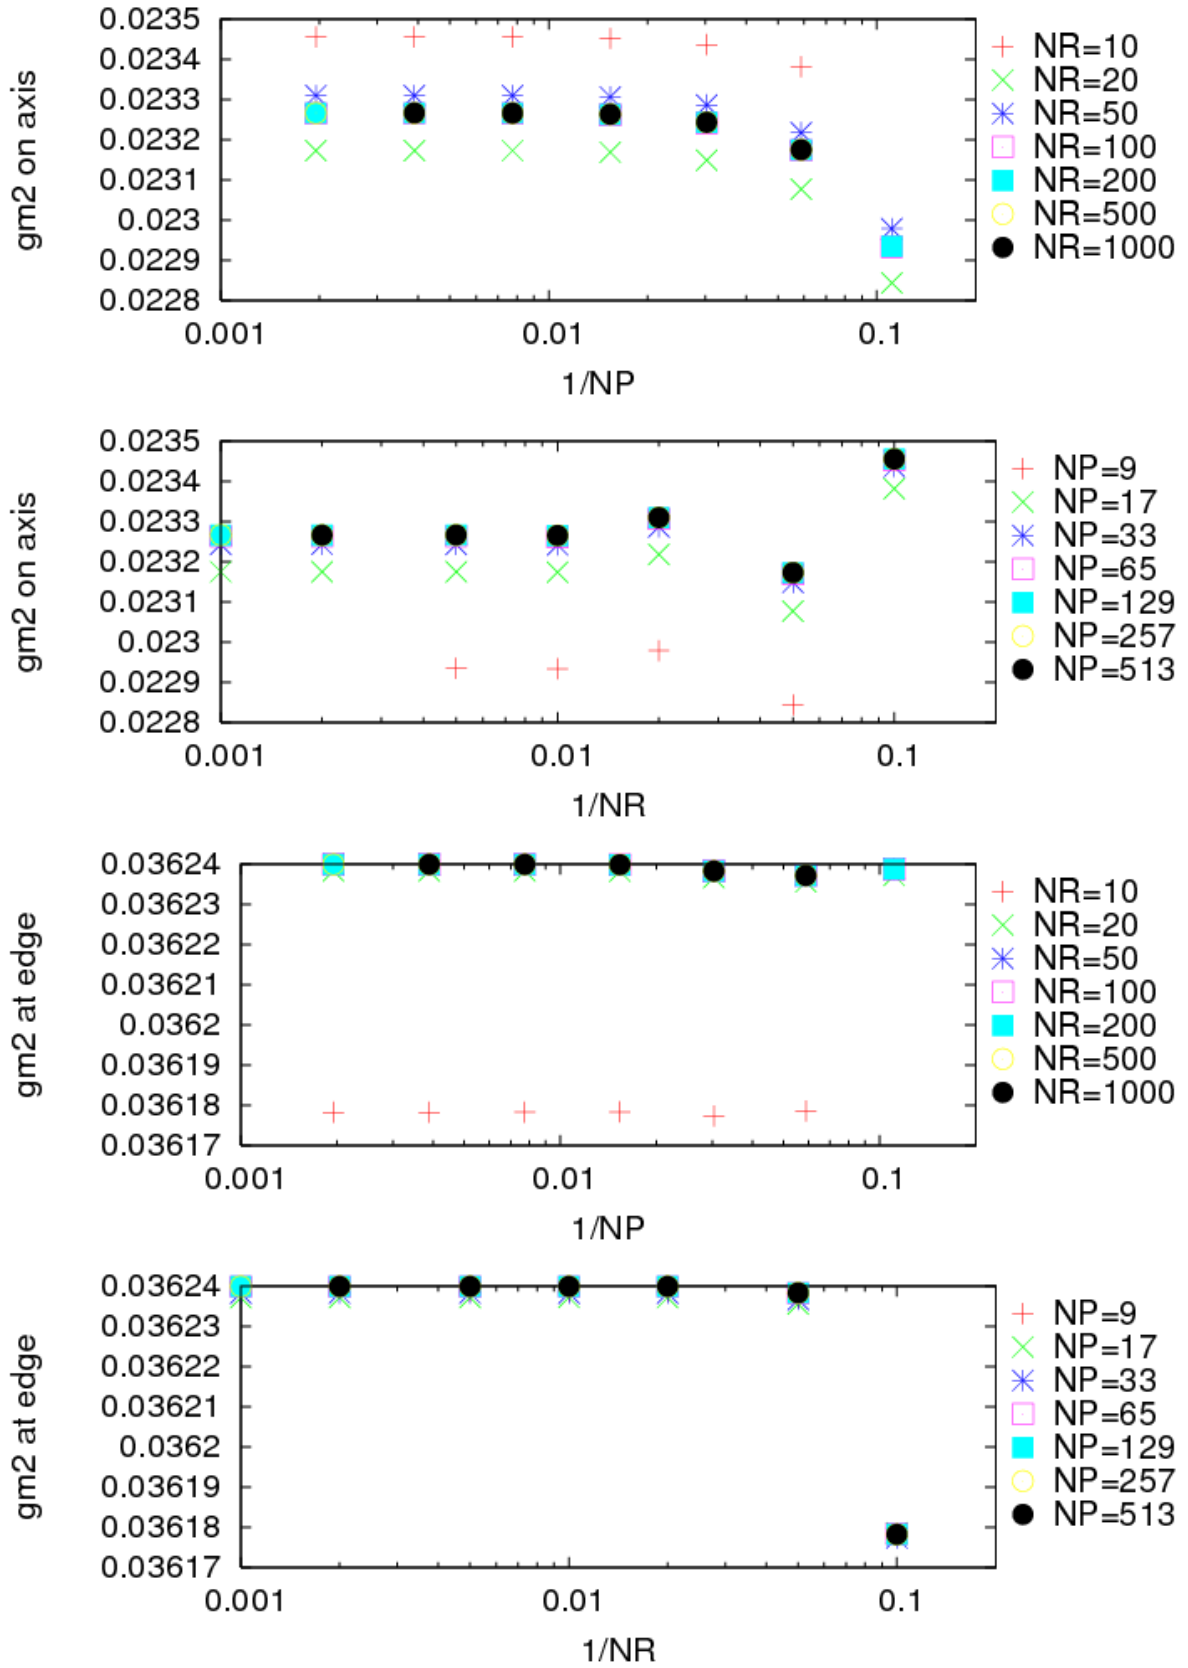

Figure 46: Convergence of gm_2

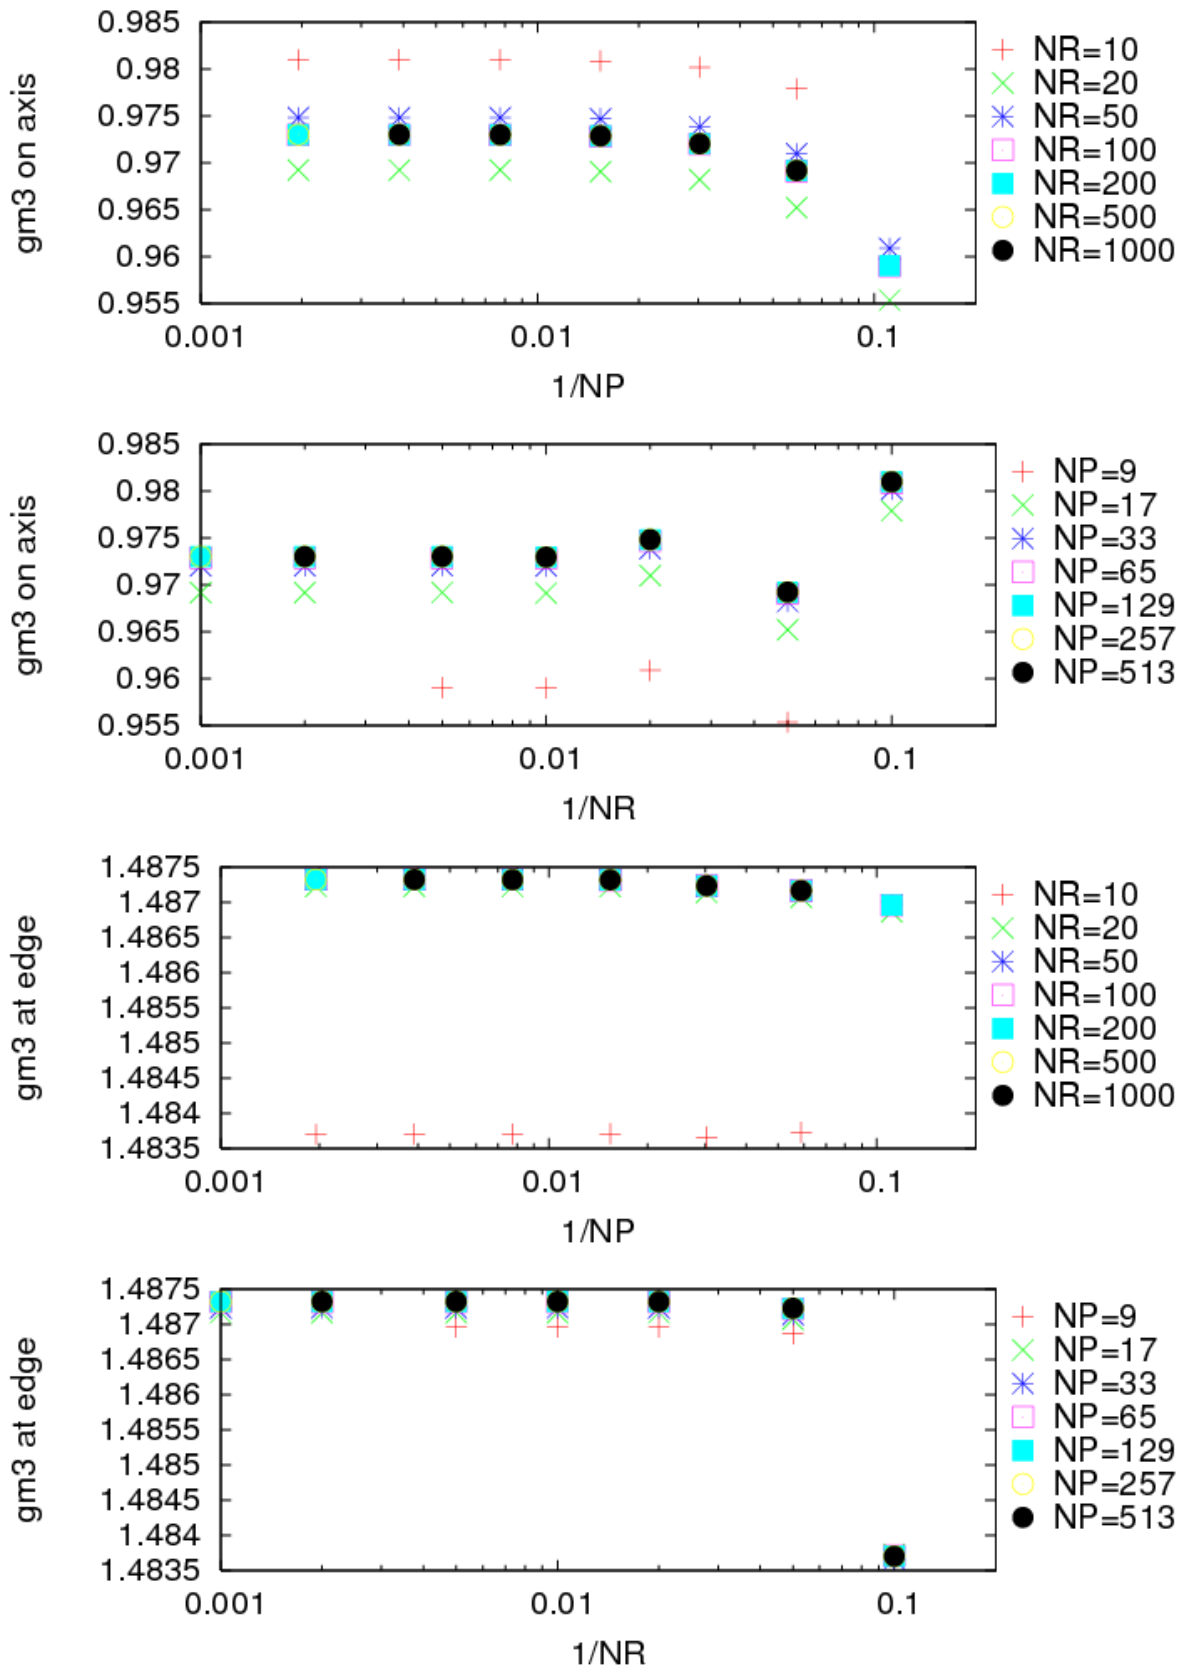

Figure 47: Convergence of $gm3$

Figure 48: convergence of F_{dia}

6.2 Coupled ETS/HELENA runs

These comparisons involved running the ETS with HELENA with varying NR and NP to 10s. The results are shown in figures 49, 50, 51, 52, 53, 54, 55 and 56.

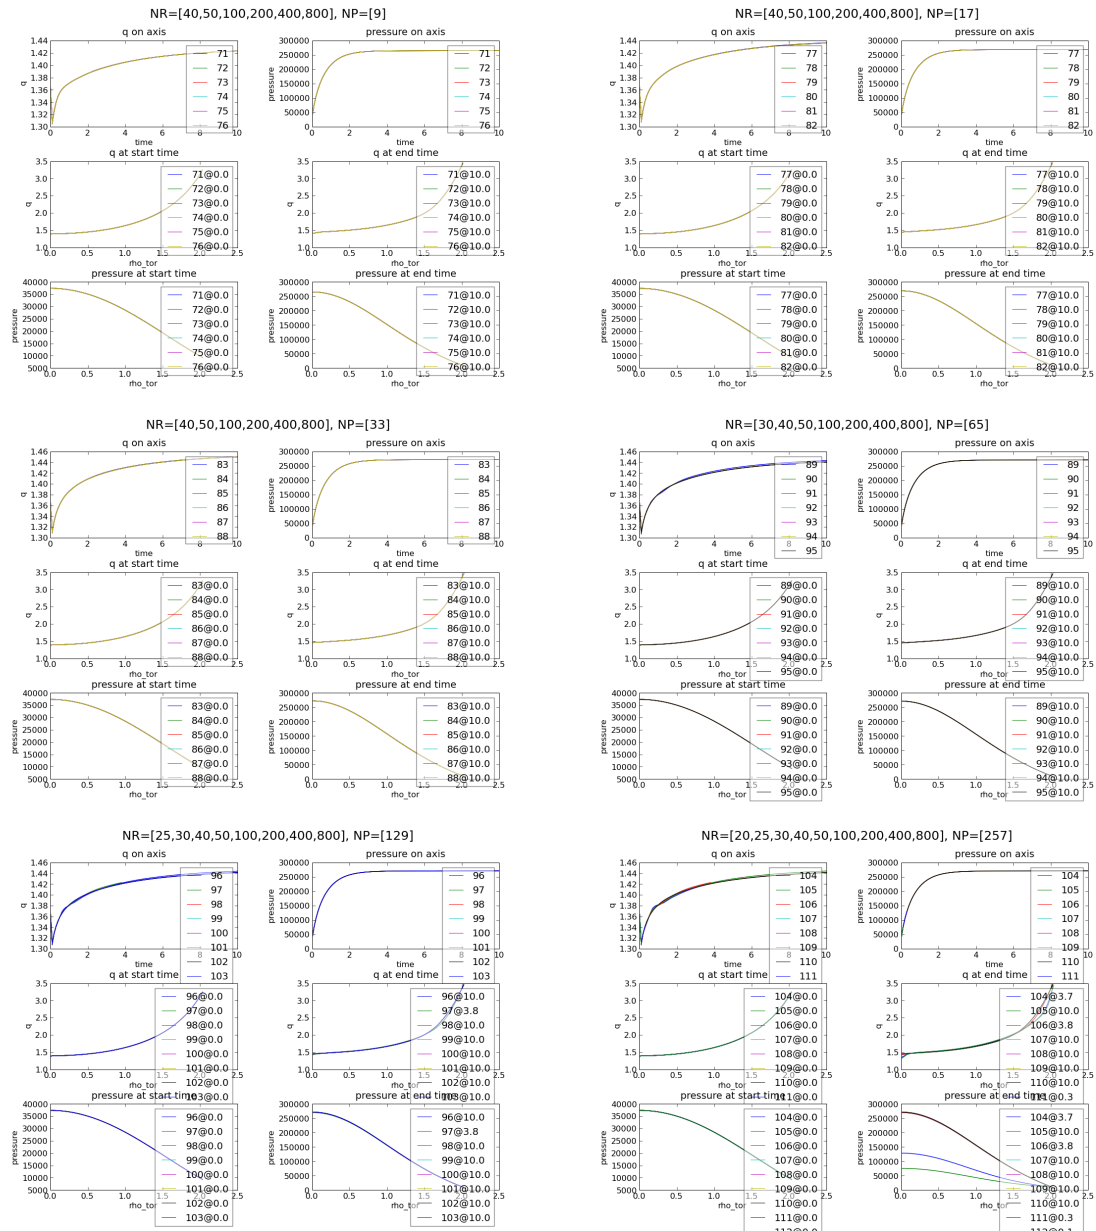

Figure 49: Convergence of equilibrium quantities for fixed NPs

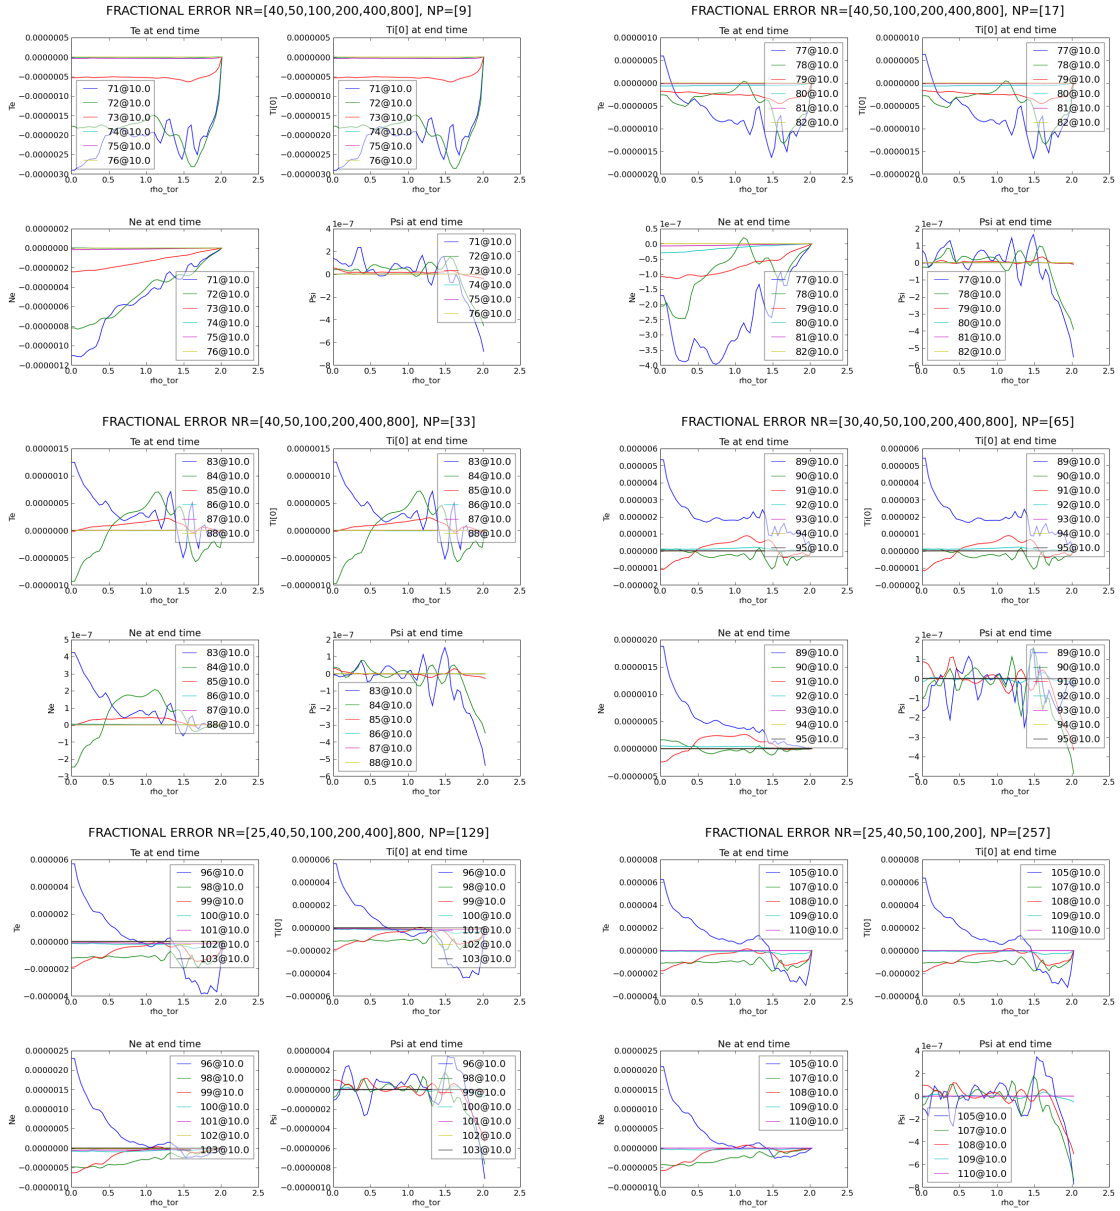

Figure 55: Convergence of coreprof quantities for fixed NPs

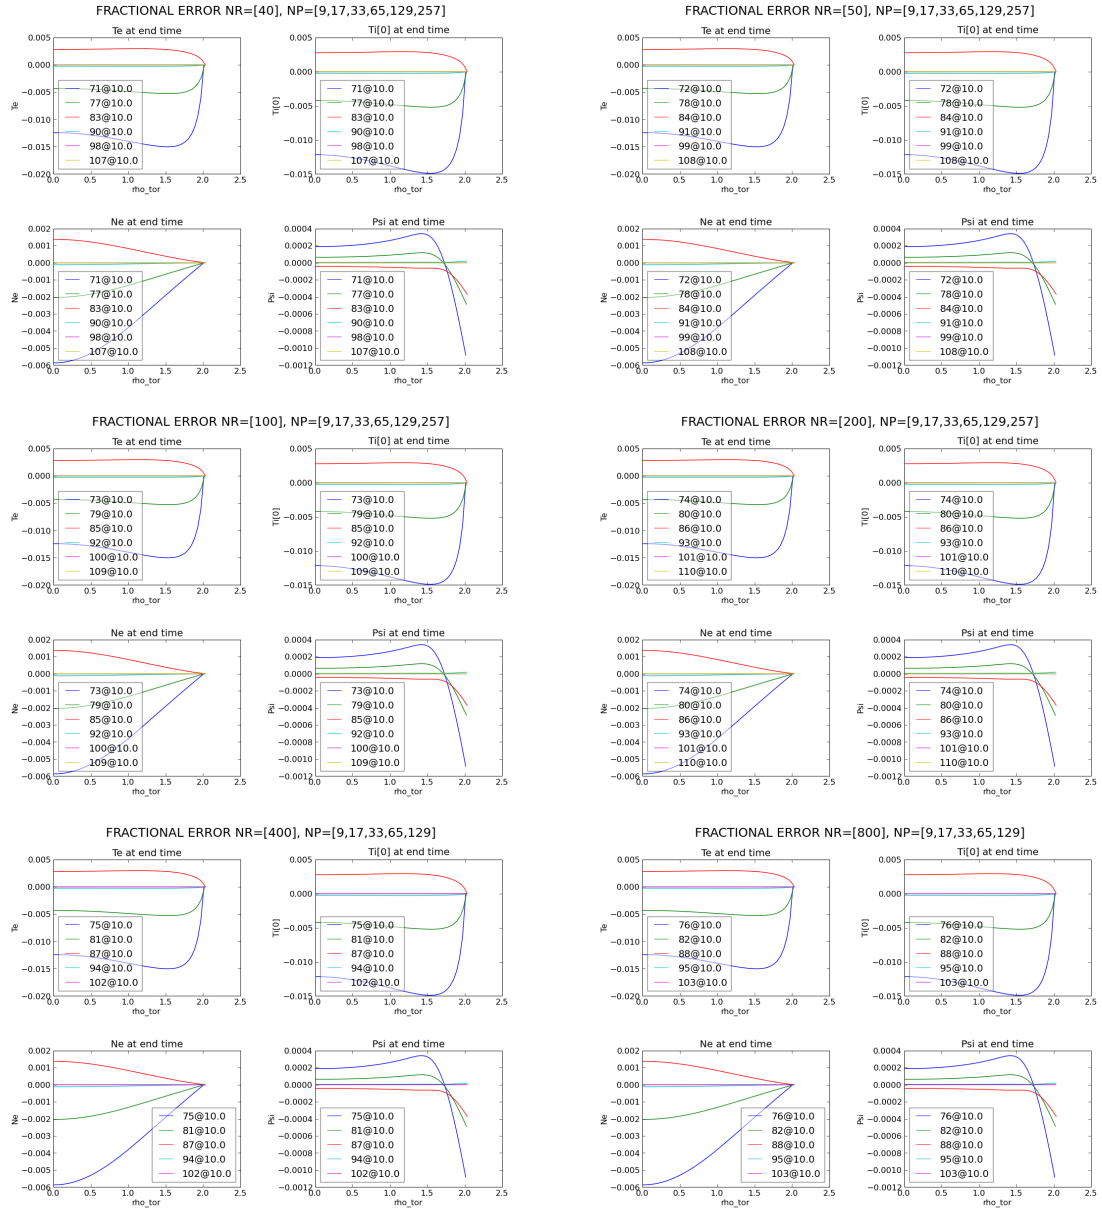

Figure 56: Convergence of coreprof quantities for fixed NRs

7 Comparison of cases with BDSEQ, EMEQ and HELENA

Results are shown in figures 57, 58, 59, 60 and 61.

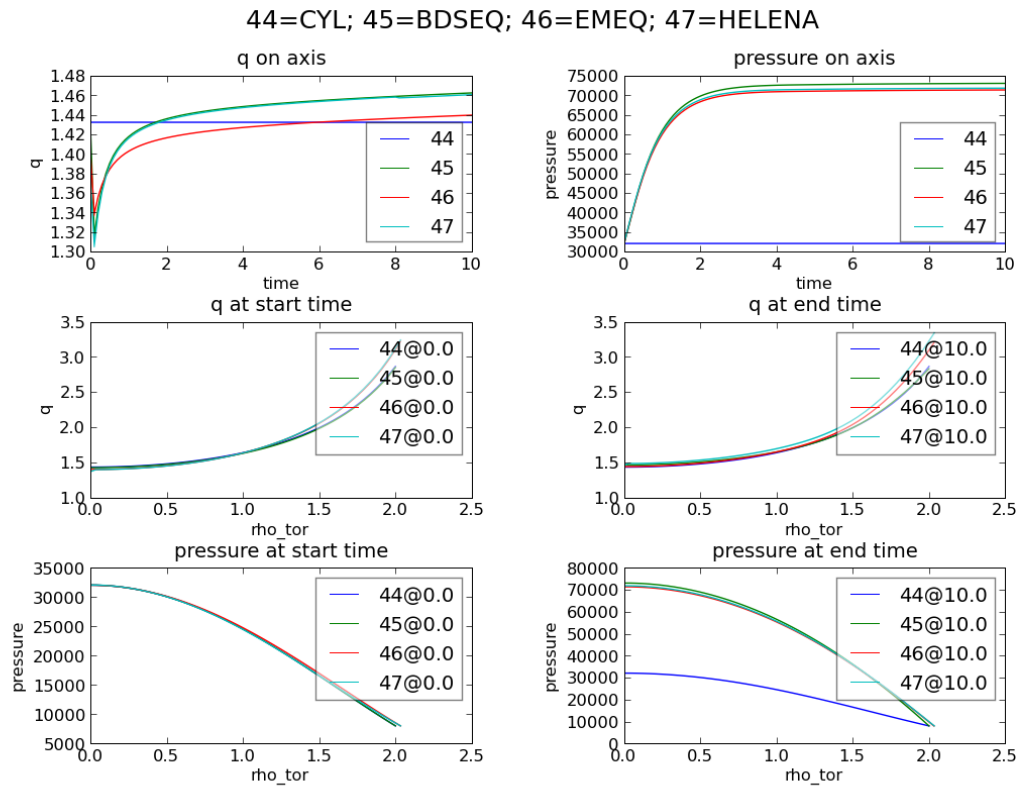

Figure 57: Cylindrical and toroidal cases.

Comparison of 5/62 (EMEQ), 5/63 (BDSEQ) & 5/64 (HELENA)

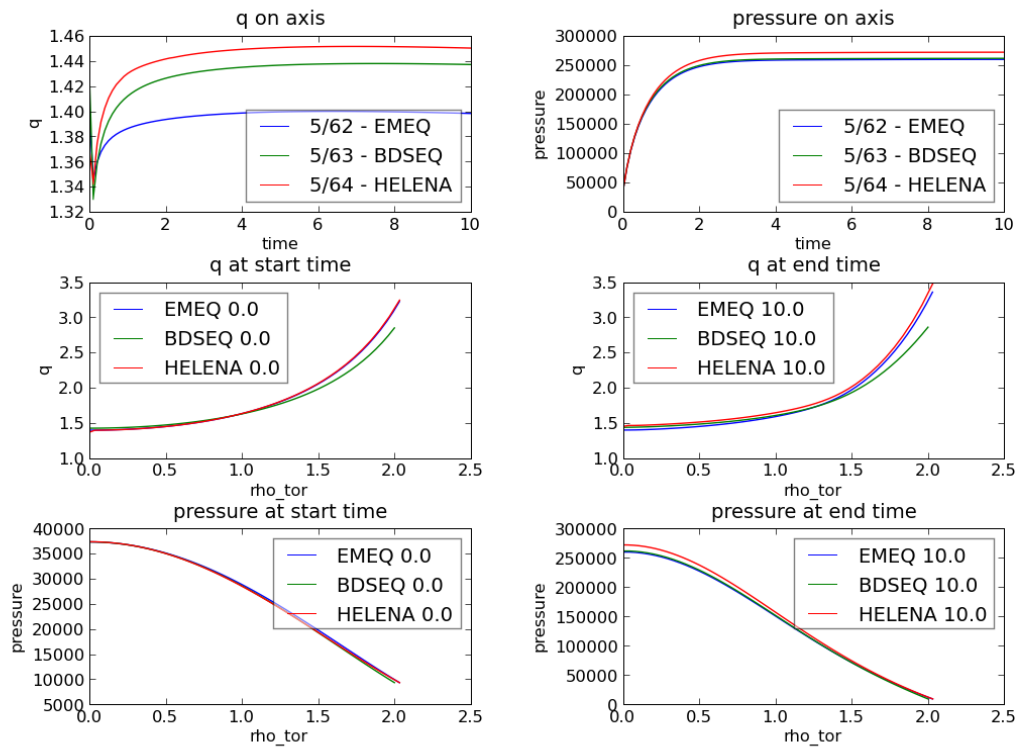

Figure 58: Comparisons of ETS cases with EMEQ, BDSEQ and HELENA (without equilibrium augmentation).

Comparison of 5/65 (EMEQ), 5/66 (BDSEQ) & 5/67 (HELENA)

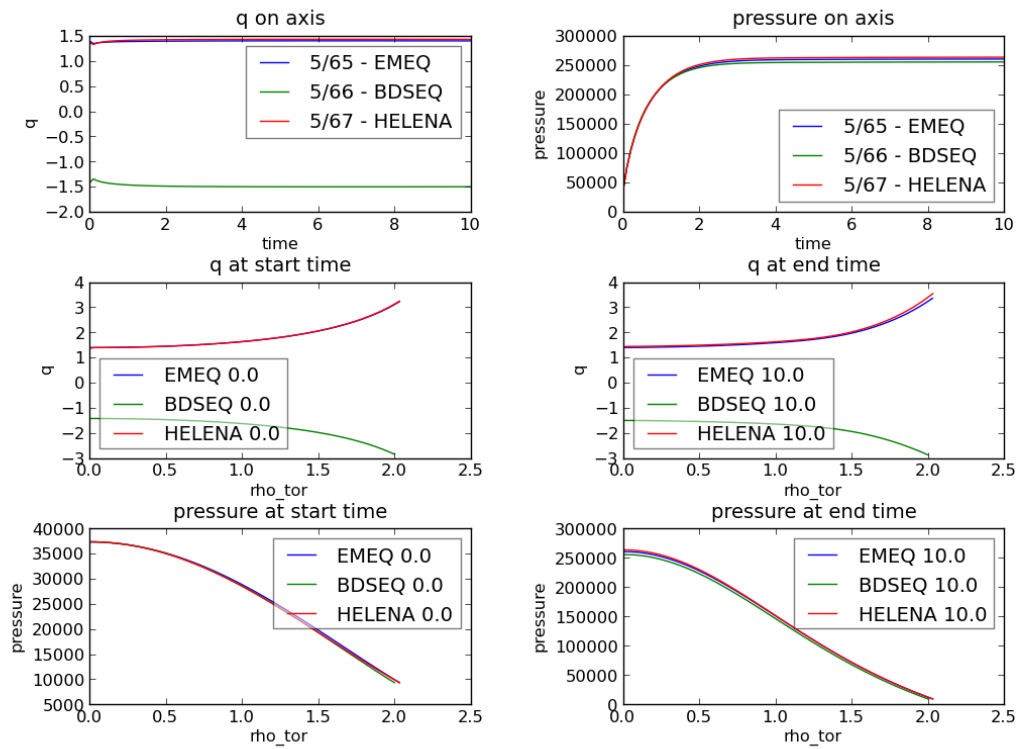

Figure 59: Comparisons of ETS cases with EMEQ, BDSEQ and HELENA (with equilibrium augmentation).

Comparison of 5/68 (EMEQ), 5/69 (BDSEQ) & 5/70 (HELENA)

Figure 60: Comparisons of ETS cases with EMEQ, BDSEQ and HELENA. Continued from 65–67.

Comparison of 5/65 (EMEQ), 5/66 (BDSEQ) & 5/67 (HELENA)

Figure 61: Comparisons of ETS cases with EMEQ, BDSEQ and HELENA. Showing the combined runs.

8 Comparison of ITM neoclassical modules

The results of comparing “NEOWES” from IMP4 and “NEO” (an implementation of NCLASS done as part of thye COS branch of the ETS) are presented.

8.1 Circular plasma; D only

The results for `test/5/64` at 10s with D are shown in figure [62](#). In the cases shown, the neoclassical coefficients presented were not used in the calculations.

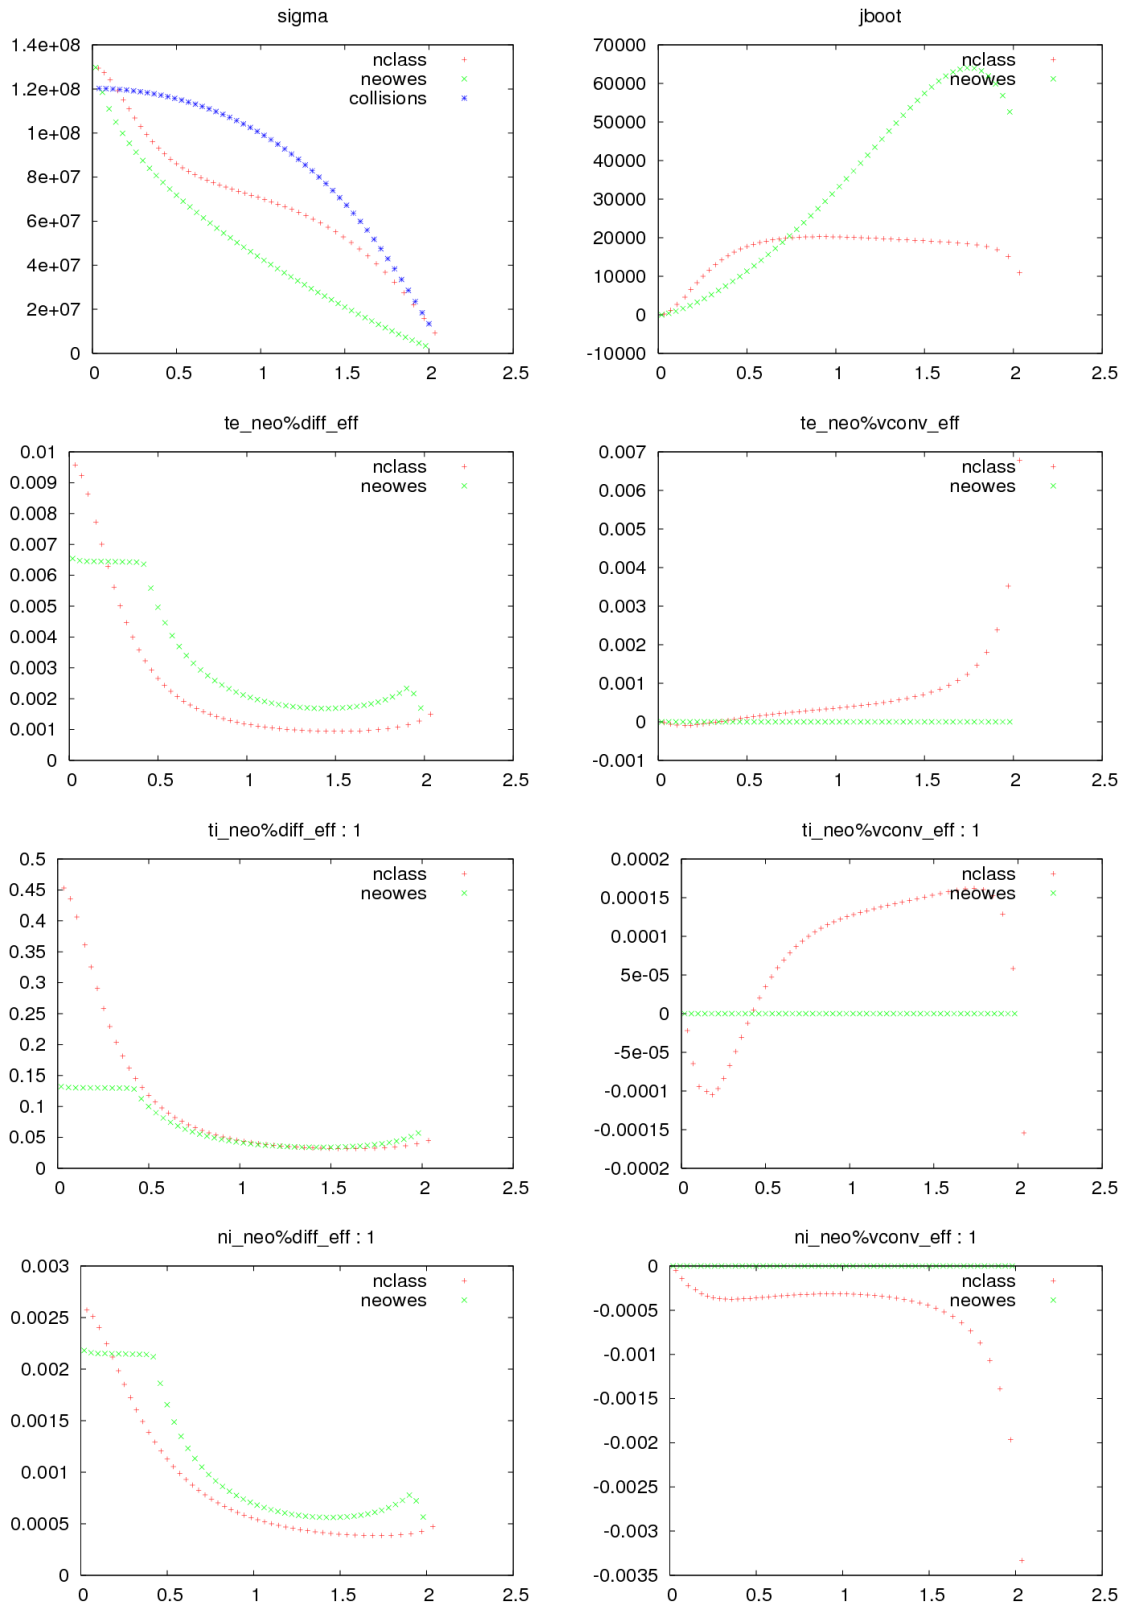

Figure 62: Neoclassical comparison between “NEO” (= NCLASS) and “NEOWES” for a pure D case.

8.2 Circular plasma; D, T and two isotopes of He

The results for `test/5/64` at 10s with D , T , ${}^3\text{He}$ and ${}^4\text{He}$ are shown in figure [63](#).

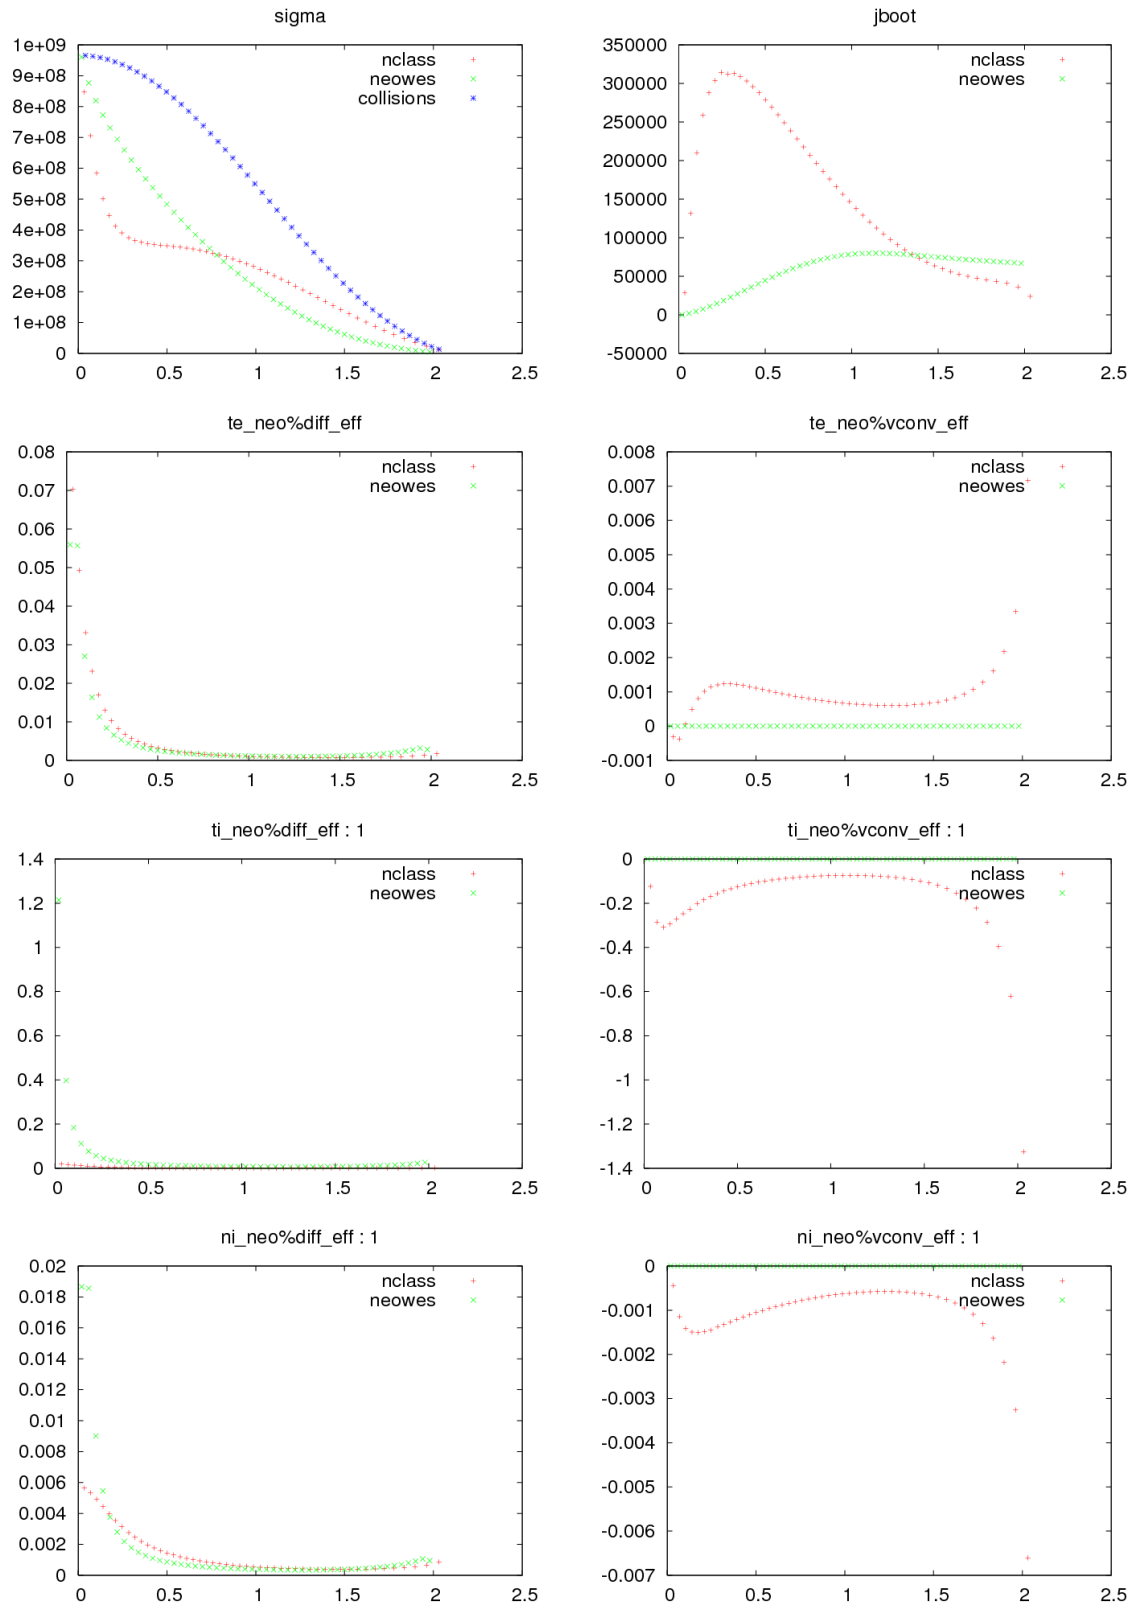

Figure 63: Neoclassical comparison between “NEO” (= NCLASS) and “NEOWES” for a multi-species case.

9 Impurities

9.1 Cases 5/113 – 5/116: 2 impurities

These cases are run with 2 impurity species for a cylindrical case, and then with BDSEQ, EMEQ and HELENA. The resultant charge state density profiles are shown in figure 64. These cases use atomic physics data from Roman Zagorski.

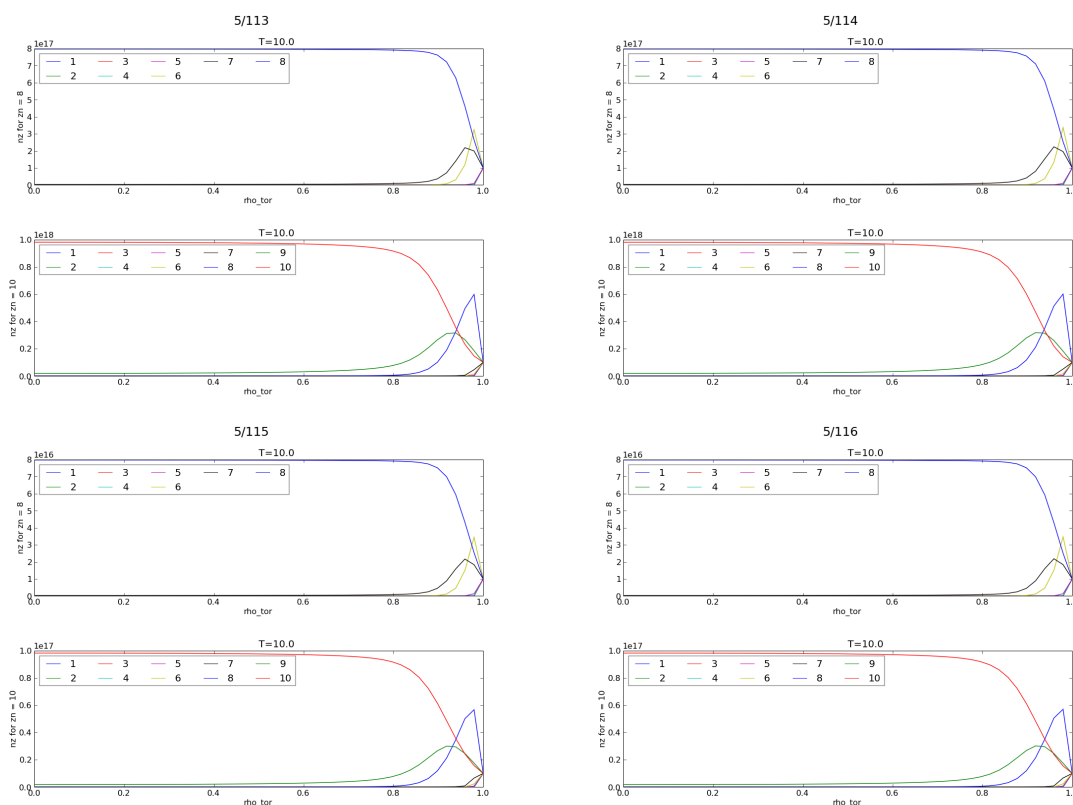

Figure 64: Runs with 2 species of impurities with a cylindrical equilibrium, BDSEQ, EMEQ and HELENA.

9.2 W

Profiles of the charge states of W are shown in figure 65. This case uses atomic physics data from Roman Zagorski.

9.3 Atomic physics

Figure 66 shows a comparison between the ETS using atomic physics data from Roman Zagorski and the ITM AMNSPROTO package.

5/123

Figure 65: Runs with W.

Figure 66: Runs with C: on the left a case with atomic physics from Zagorski, in the middle using the AMNSPROTO version of the ITM AMNS concept, and on the right using the UAL version of AMNSPROTO.

9.3.1 Use of the ITM AMNS routines

This is still using a development version!

To initialize the rates:

```
write(*,*) 'ITM AMNSPROTO data used (via UAL)'
allocate(amns_ei(0:max_nzimp, nimp), amns_rc(0:max_nzimp, nimp), species(0:max_nzimp, nimp))
call ITM_AMNS_SETUP(amns)
call ITM_AMNS_QUERY(amns,query,answer)
write(*,*) 'AMNS data base version = ',trim(answer%string)
ei_rx%string='EI'
```

```

rc_rx%string='RC'
do iimp=1, nimp
! the following should be done behind the user's back!
  shot= COREIMPUR_OLD(1)%DESC_IMPUR%zn(IIMP)
  run = 1
  treename = 'euitm'
  call getenv('USER', USER)
  call euitm_open_env(treename,shot,run,idx,trim(USER),'amns','4.08a')
  call euitm_get(idx,'amns',amns_cpo)
  call euitm_close(idx)
!
  do izimp=0, COREIMPUR_OLD(1)%DESC_IMPUR%zn(IIMP)
    allocate(species(izimp,iimp)%components(1))
    species(izimp,iimp)%components(1)%ZN=COREIMPUR_OLD(1)%DESC_IMPUR%zn(IIMP)

Figure 71: Results of a JET simulation for 71827 based on a start from data prepared by exp2itm. With impurities.

10.4 78092

This case starts from JET/78092/3 (originally from Konz) which was a HELENA run based on JET/78092/2, which in turn was an EQUAL reconstruction based on JET data in JET/78092/1.

The relevant input for preparing the initial CPO is

```

12 Generic sources

Generic source routines have been created using the schema `sources.xsd`.

| Flag | Description |
|------------------|--|
| parameters | GLOBAL: parameters for generic source modules (ECRH, ICRH, NBI) |
| coresource | BLOCK: specify parameters for the coresource CPO |
| j | expression for j as a function of a normalized radial coordinate [A/m ²] |
| qe_exp | expression for the explicit part of the electron heating as a function of a normalized radial coordinate [W/m ³] |
| qe_imp | expression for the implicit part of the electron heating as a function of a normalized radial coordinate [W/m ³ /eV ??] |
| qi_exp | NION expressions for the explicit part of the ion heating as a function of a normalized radial coordinate [W/m ³] |
| qi_imp | NION expressions for the implicit part of the ion heating as a function of a normalized radial coordinate [W/m ³ /eV ??] |
| si_exp | NION expressions for the explicit part of the ion particle source as a function of a normalized radial coordinate [/m ³ /s] |
| si_imp | NION expressions for the implicit part of the ion particle source as a function of a normalized radial coordinate [/m ³ /s.m ³ ??] |
| ui_exp | NION expressions for the explicit part of the toroidal velocity source as a function of a normalized radial coordinate [??] |
| ui_imp | NION expressions for the implicit part of the toroidal velocity source as a function of a normalized radial coordinate [??] |
| j_int | desired integral of j as a function of a normalized radial coordinate [A/m ²] (not yet implemented) |
| qe_exp_int | desired integral of the explicit part of the electron heating as a function of a normalized radial coordinate [W/m ³] |
| qe_imp_int | desired integral of the implicit part of the electron heating as a function of a normalized radial coordinate [W/m ³ /eV ??] (not yet implemented) |
| qi_exp_int | NION desired integrals of the explicit part of the ion heating as a function of a normalized radial coordinate [W/m ³] |
| qi_imp_int | NION desired integrals of the implicit part of the ion heating as a function of a normalized radial coordinate [W/m ³ /eV ??] (not yet implemented) |
| si_exp_int | NION desired integrals of the explicit part of the ion particle source as a function of a normalized radial coordinate [/m ³ /s] |
| <i>continued</i> | |

| <i>continued</i> | |
|------------------|---|
| Flag | Description |
| si_imp_int | NION desired integrals of the implicit part of the ion particle source as a function of a normalized radial coordinate $[\text{m}^3/\text{s.m}^3 \text{ ??}]$ (not yet implemented) |
| ui_exp_int | NION desired integrals of the explicit part of the toroidal velocity source as a function of a normalized radial coordinate [??] |
| ui_imp_int | NION desired integrals of the implicit part of the toroidal velocity source as a function of a normalized radial coordinate [??] (not yet implemented) |

Three instances have been created for NBI, ECRH and ICRH.

12.1 case_5_118

The NBI module uses the input:

```
<?xml version="1.0"?>

<?xml-stylesheet type="text/xsl" href="./ets.xsl" charset="ISO-8859-1"?>

<parameters>

  <coresource>
    <j>
0.0
    </j>
    <qe_exp>
exp(-((x-0.0)/0.4)^2)
    </qe_exp>
    <qe_imp>
0.0
    </qe_imp>
    <qi_exp>
exp(-((x-0.0)/0.4)^2)
    </qi_exp>
    <qi_imp>
0.0
    </qi_imp>
    <si_exp>
exp(-((x-0.0)/0.4)^2)
    </si_exp>
    <si_imp>
0.0
    </si_imp>
    <ui_exp>
0.0
```

```

    </ui_exp>
    <ui_imp>
0.0
    </ui_imp>
    <j_int>      0.0    </j_int>
    <qe_exp_int> 10.0e6 </qe_exp_int>
    <qe_imp_int>  0.0    </qe_imp_int>
    <qi_exp_int> 10.0e6 </qi_exp_int>
    <qi_imp_int>  0.0    </qi_imp_int>
    <si_exp_int> 1.25e20 </si_exp_int>
    <si_imp_int>  0.0    </si_imp_int>
    <ui_exp_int>  0.0    </ui_exp_int>
    <ui_imp_int>  0.0    </ui_imp_int>
  </coresource>

</parameters>

```

The ECRH module uses the input:

```

<?xml version="1.0"?>

<?xml-stylesheet type="text/xsl" href="./ets.xsl" charset="ISO-8859-1"?>

<parameters>

  <coresource>
    <j>
0.0
    </j>
    <qe_exp>
exp(-((x-0.5)/0.05)^2)
    </qe_exp>
    <qe_imp>
0.0
    </qe_imp>
    <qi_exp>
0.0
    </qi_exp>
    <qi_imp>
0.0
    </qi_imp>
    <si_exp>
0.0
    </si_exp>
    <si_imp>
0.0
    </si_imp>
    <ui_exp>
0.0

```

```

    </ui_exp>
    <ui_imp>
0.0
    </ui_imp>
    <j_int>      0.0      </j_int>
    <qe_exp_int> 20.0e6   </qe_exp_int>
    <qe_imp_int>  0.0     </qe_imp_int>
    <qi_exp_int>  0.0     </qi_exp_int>
    <qi_imp_int>  0.0     </qi_imp_int>
    <si_exp_int>  0.0     </si_exp_int>
    <si_imp_int>  0.0     </si_imp_int>
    <ui_exp_int>  0.0     </ui_exp_int>
    <ui_imp_int>  0.0     </ui_imp_int>
  </coresource>

```

```
</parameters>
```

The ICRH module uses the input:

```

<?xml version="1.0"?>

<?xml-stylesheet type="text/xsl" href="./ets.xsl" charset="ISO-8859-1"?>

<parameters>

  <coresource>
    <j>
0.0
    </j>
    <qe_exp>
0.0
    </qe_exp>
    <qe_imp>
0.0
    </qe_imp>
    <qi_exp>
exp(-((x-0.2)/0.20)^2)
    </qi_exp>
    <qi_imp>
0.0
    </qi_imp>
    <si_exp>
0.0
    </si_exp>
    <si_imp>
0.0
    </si_imp>
    <ui_exp>
0.0
    </ui_exp>

```

```

<qe_imp_int> 0.0    </qe_imp_int>
<qi_exp_int> 20.0e6 </qi_exp_int>
<qi_imp_int> 0.0    </qi_imp_int>
<si_exp_int> 0.0    </si_exp_int>
<si_imp_int> 0.0    </si_imp_int>
<ui_exp_int> 0.0    </ui_exp_int>
<ui_imp_int> 0.0    </ui_imp_int>
</coresource>

</parameters>

```

Figure 80: Resultant coresource from NBI, ECRH and ICRH.

Figure 81: Results of using the NBI, ECRH and ICRH core sources.

13 Equilibrium augmentation

In order to calculate $\psi(R, Z)$ as well as $B_R(R, Z)$, $B_Z(R, Z)$ and $B_\phi(R, Z)$ when only $R(\psi, \theta)$ and $Z(\psi, \theta)$ are present, a short routine was written to calculate a spline representation of $\psi(R, Z)$ (using the `dierckx` routine “`surfit`”), which is then used to calculate $\psi(R, Z)$ (using “`bispev`”) as well as $B_R(R, Z)$ and $B_Z(R, Z)$ (using “`parder`”). Similarly $B_\phi(R, Z)$ is calculated from the spline of F_{dia} .

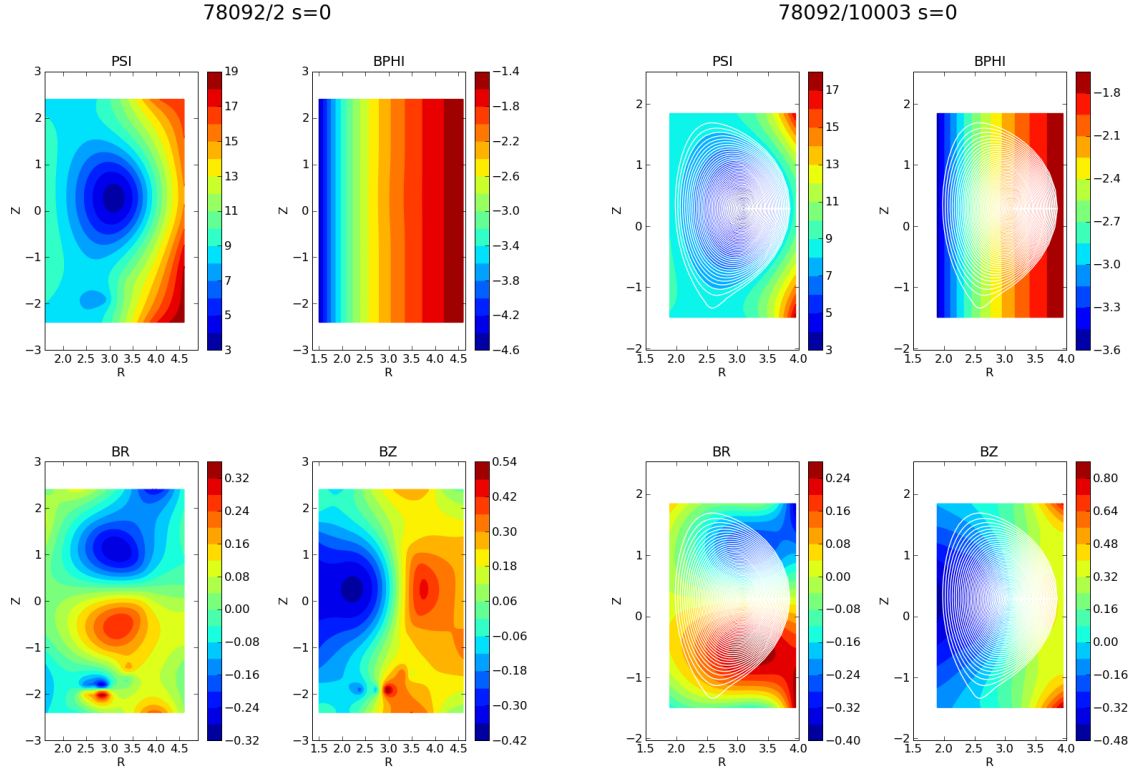

Figure 82: On the left the original data from the EQUAL simulation. On the right the reconstruction of $\psi(R, Z)$, B_R , B_Z and B_ϕ arising from a HELENA simulation based on the EQUAL simulation.

In figure 82 the results of this procedure are shown, and a more detailed comparison is shown in 83: in blue data from the original EQUAL run are shown, and in red the results of the equilibrium augmentation applied to a HELENA run based on the EQUAL data.

The results for an AUG and a JET shot are shown in 84.

Comparison of original ψ , b_r , b_z and those coming from augmentation

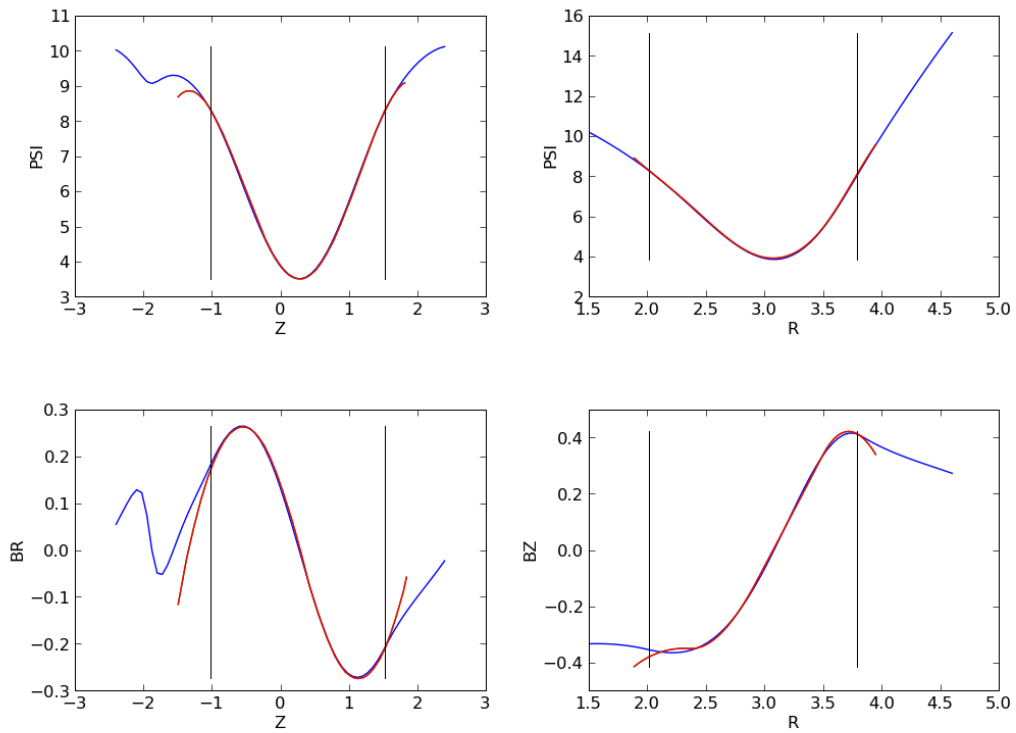

Figure 83: Comparison of ψ , B_R , B_Z arising from equilibrium augmentation and the original.

Figure 84: Reconstruction of $\psi(R, Z)$, B_R , B_Z and B_ϕ for an AUG and a JET ETS simulation.

14 Kepler ETS Workflow

The result of the Kepler implementation of the ETS is shown in 85 with the workflow depicted in figures 86, 87, 88, 89, 90, 91, 92, 93, 94, 95 and 96.
