cpoinstances [568]

[568] https://www.efda-itm.eu/ITM/html/cpoinstances__4.10b.10.html

7.9.8 4.10b.11

7.9.8.1 ITM Types

Generated from the ITM data structure schemas. Time-dependent values are shown in green. Anonymous structure (complex) types in the schemas are given parent element names; a prefix or suffix (eg type_, _type, _t) can be added if required.

7.9.8.1.1 Primitive Types

Clear definitions required.

7.9.8.1.2 float

7.9.8.1.3 integer

7.9.8.1.4 string

7.9.8.1.5 Array Types

Clear definitions required.

7.9.8.1.6 array3dcplx_type

Example: Complex numbers (3D)

7.9.8.1.7 array3dflt_type

Example: [[[1.0,2.0,3.0],[5.0,6.0,7.0]],[[1.0,2.0,3.0],[5.0,6.0,7.0]]]

7.9.8.1.8 array3dint_type

Example: [[[1,2,3],[5,6,7]],[[1,2,3],[5,6,7]]]

7.9.8.1.9 array4dflt_type

Example: [[[[1.0,2.0,3.0],[5.0,6.0,7.0]],[[1.0,2.0,3.0],[5.0,6.0,7.0]]],[[[1.0,2.0,3.0],[5.0,6.0,7.0]],[[1.0,2.0,3.0],[5.0,6.0,7.0]]]]

7.9.8.1.10 array5dflt_type

Example: [[[[[1.0,2.0,3.0],[5.0,6.0,7.0]],[[1.0,2.0,3.0],[5.0,6.0,7.0]]],[[[1.0,2.0,3.0],[5.0,6.0,7.0]],[[1.0,2.0,3.0],[5.0,6.0,7.0]]]],[[[[1.0,2.

7.9.8.1.11 array6dflt_type

Example: [[[[[[1.0,2.0,3.0],[5.0,6.0,7.0]],[[1.0,2.0,3.0],[5.0,6.0,7.0]]],[[[1.0,2.0,3.0],[5.0,6.0,7.0]],[[1.0,2.0,3.0],[5.0,6.0,7.0]]]],[[[[1.0,2

7.9.8.1.12 array7dflt_type

Example: [[[[[[[1.0,2.0,3.0],[5.0,6.0,7.0]],[[1.0,2.0,3.0],[5.0,6.0,7.0]]],[[[1.0,2.0,3.0],[5.0,6.0,7.0]],[[1.0,2.0,3.0],[5.0,6.0,7.0]]]],[[[[1.0,

7.9.8.1.13 cplx_type

Example: Complex number (scalar)

7.9.8.1.14 matcplx_type

Example: Complex numbers (matrix)

7.9.8.1.15 matflt_type

Example: [[1.0,2.0,3.0],[5.0,6.0,7.0]]

7.9.8.1.16 matint_type

Example: [[1,2,3],[4,5,6]]

7.9.8.1.17 veccplx_type

Example: Complex numbers (vector)

7.9.8.1.18 vecflt_type

Example: [1.0,-3e5,-4.0e-3]

7.9.8.1.19 vecint_type

Example: [1,2,3]

7.9.8.1.20 vecstring_type

Example: ["aaa","bb","cccc"]

7.9.8.1.21 Structure Types

7.9.8.1.22 CPO Structures

7.9.8.1.23 amns

Description of AMNS processes for one species.

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
version	string (7.9.8.1.4)	Version of the data.
source	string (7.9.8.1.4)	Source of the data.
zn	integer (7.9.8.1.3)	Nuclear charge [units of elementary charge];
amn	float (7.9.8.1.2)	Mass of atom [amu]
process(:)	amns_processType (7.9.8.1.76)	Identifiers for processes; Vector(nprocs)
tables(:)	tables (7.9.8.1.449)	Rate tables for processes. Vector(nprocs)
tables_coord(:)	tables_coord (7.9.8.1.450)	Array of possible coordinate systems for tables. Vector(ncoordbases)
version_ind(:)	version_ind (7.9.8.1.508)	Array of available releases/versions of the AMNS data; each element contains information about the AMNS data that is included in the release. This part of the CPO is filled and stored only into shot/run=0/1, playing the role of a catalogue.
codeparam	codeparam (7.9.8.1.105)	Code parameters
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar

7.9.8.1.24 antennas

Antenna systems for heating and current drive in the electron cyclotron (EC), ion cylcotron (IC) and lower hybrid (LH) frequencies. Time-dependent CPO.

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
antenna_ec(:)	antenna_ec (7.9.8.1.77)	Vector of Electron Cyclotron antennas. Time-dependent
antenna_ic(:)	antenna_ic (7.9.8.1.78)	Vector of Ion Cyclotron antennas. Time-dependent
antenna_lh(:)	antenna_lh (7.9.8.1.79)	Vector of Lower Hybrid antennas. Time-dependent
codeparam	codeparam (7.9.8.1.105)	Code parameters
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar

7.9.8.1.25 bb_shield

Breeding blanket and relevant shield. CPO. Time-dependent CPO.

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item

member	type	description
type	string (7.9.8.1.4)	Type of breeding blanket (HCLL, DCLL, HCPB, ...). String
limits	limits (7.9.8.1.281)	Limits
li6_enrich	float (7.9.8.1.2)	Lithium 6 enrichement (at%).
geom	geom (7.9.8.1.254)	Geometry between components
neut_results	neut_results (7.9.8.1.317)	Neutronic results
shield	shield (7.9.8.1.426)	Shield
bb	bb (7.9.8.1.83)	Breeding blanket
hcll	hcll (7.9.8.1.259)	Data specific to HCLL blanket concept
codeparam	codeparam (7.9.8.1.105)	Code parameters
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar

7.9.8.1.26 bolometer

Bolometer diagnostic; Time-dependent CPO

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
setup	bolometer_setup (7.9.8.1.92)	diagnostic setup information
measure	bolometer_measure (7.9.8.1.90)	Measured values
process	bolometer_processed (7.9.8.1.91)	Processed quantities
codeparam	codeparam (7.9.8.1.105)	Code parameters
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar

7.9.8.1.27 bremsstrahl

Bremsstrahlung diagnostic; Time-dependent CPO

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
setup	bremsstrahl_setup (7.9.8.1.100)	diagnostic setup information
measure	bremsstrahl_measure (7.9.8.1.99)	Measured values
codeparam	codeparam (7.9.8.1.105)	Code parameters
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar

7.9.8.1.28 compositionc

Species description (ions, impurities, neutrals).

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
compositions	compositions_type (7.9.8.1.127)	Contains all the composition information for the simulation (main ions, impurities, neutrals, edge species).
codeparam	codeparam (7.9.8.1.105)	Code parameters
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar

7.9.8.1.29 coredelta

Generic instant change of the radial core profiles due to pellet, MHD, ... Time-dependent CPO.

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
composition	composition (7.9.8.1.123)	Plasma composition (description of ion species). OBSOLESCENT.
desc_impur	desc_impur (7.9.8.1.164)	Description of the impurities (list of ion species and possibly different charge states). OBSOLESCENT.
compositions	compositions_type (7.9.8.1.127)	Contains all the composition information for the simulation (main ions, impurities, neutrals, edge species).
values(:)	coredelta_values (7.9.8.1.132)	Description of the delta term for the various origins. Array of structure (ndelta). Time-dependent
codeparam	codeparam (7.9.8.1.105)	Code parameters

member	type	description
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar

7.9.8.1.30 corefast

Flux surface averaged fluid measures and transport coefficients of fast particle populations. Here the concept of a fast particle population refer to the difference between the total population and the thermal population. This separation of populations may in practise be achieved differently depending on the physics model. A description of how the separation is achieved should therefore be provided in corefast/values/filter/. Time-dependent CPO.

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
composition	composition (7.9.8.1.123)	Plasma composition (description of ion species). OBSOLESCENT.
desc_impur	desc_impur (7.9.8.1.164)	Description of the impurities (list of ion species and possibly different charge states). OBSOLESCENT.
compositions	compositions_type (7.9.8.1.127)	Contains all the composition information for the simulation (main ions, impurities, neutrals, edge species).
toroid_field	b0r0 (7.9.8.1.82)	Characteristics of the vacuum toroidal field, redundant with the toroidfield CPO, to document the normalisation of rho and j in this CPO.
values(:)	corefast_values (7.9.8.1.134)	Description of the fast particle terms of various origins. Array of structure (nfast). Time-dependent.
codeparam	codeparam (7.9.8.1.105)	Code parameters
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar

7.9.8.1.31 coreimpur

Impurity species (i.e. ion species with multiple charge states), radial core profiles. For heavy impurities, some ionisation states can be grouped into ”bundles”. Can be the result of an impurity transport code or experimental measurements. Time-dependent CPO

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
rho_tor_norm	vecflt_type (7.9.8.1.18)	Normalised toroidal flux coordinate values (= rho_tor normalised to the value at the last grid point); Time-dependent; Vector (nrho)
rho_tor	vecflt_type (7.9.8.1.18)	Toroidal flux coordinate (not normalised, equivalent to rho_tor_norm) [m]; Vector (nrho). Time-dependent.
psi	vecflt_type (7.9.8.1.18)	Poloidal flux [Wb], without 1/2pi and such that Bp=|grad psi| /R/2/pi. Time-dependent; Vector (nrho)
volume	vecflt_type (7.9.8.1.18)	Volume enclosed in the flux surface [m^3]; Time-dependent; Vector (nrho)
area	vecflt_type (7.9.8.1.18)	Cross-sectional area of the flux surface [m^2]; Time-dependent; Vector (nrho)
source	vecstring_type (7.9.8.1.20)	Source of the profile (any comment describing the origin of the impurity profiles : code, path to diagnostic signals, massaging, ...); Array of strings (nimp)
flag	vecint_type (7.9.8.1.19)	Flag describing how the profile has been processed : 0-not calculated; 1-interpretative; 2-calculated by the transport solver; 3-calculated by a separate code : in that case only, description of the code provided in codeparam at the same level; 4-used value from the previous time step; Time-dependent; Vector(nimp)
desc_impur	desc_impur (7.9.8.1.164)	Description of the impurities (list of ion species and possibly different charge states). OBSOLESCENT.
compositions	compositions_type (7.9.8.1.127)	Contains all the composition information for the simulation (main ions, impurities, neutrals, edge species).
atomic_data	vecstring_type (7.9.8.1.20)	Reference for the atomic data used for each impurity. Array of strings (nimp)
impurity(:)	impurity_type (7.9.8.1.266)	Array(nimp). Time-dependent
diagnostic	coreimpurediag_type (7.9.8.1.146)	NO DOCS
diagnosticsum	coreimpurediag_sum (7.9.8.1.144)	NO DOCS
codeparam	codeparam (7.9.8.1.105)	Code parameters
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar.

7.9.8.1.32 coreneutrals

Core plasma neutrals description. Time-dependent CPO.

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item

member	type	description
rho_tor	vecflt_type (7.9.8.1.18)	Toroidal flux coordinate (not normalised, equivalent to rho_tor_norm) [m]; Vector (nrho). Time-dependent.
rho_tor_norm	vecflt_type (7.9.8.1.18)	Normalised toroidal flux coordinate values (= rho_tor normalised to the value at the last grid point); Time-dependent; Vector (nrho)
psi	vecflt_type (7.9.8.1.18)	Poloidal flux [Wb], without 1/2pi and such that Bp=|grad psi| /R/2/pi. Time-dependent; Vector (nrho)
volume	vecflt_type (7.9.8.1.18)	Volume enclosed in the flux surface [m^3]; Time-dependent; Vector (nrho)
area	vecflt_type (7.9.8.1.18)	Cross-sectional area of the flux surface [m^2]; Time-dependent; Vector (nrho)
neutcompo	composition_neutrals (7.9.8.1.124)	Description of neutrals species. OBSOLESCENT
composition	composition (7.9.8.1.123)	Plasma composition (description of ion species). OBSOLESCENT.
desc_impur	desc_impur (7.9.8.1.164)	Description of the impurities (list of ion species and possibly different charge states). OBSOLESCENT.
compositions	compositions_type (7.9.8.1.127)	Contains all the composition information for the simulation (main ions, impurities, neutrals, edge species).
profiles(:)	neutral_complex_type (7.9.8.1.318)	Profiles derived from the fields solved in the transport equations, or from experiment. Array(nneut). Time-dependent
ioncoeff(:)	coefficients_neutrals (7.9.8.1.106)	Recycling and sputtering coefficients for each ion in composition. Array(nion). Time-dependent
impcoeff(:)	impcoeff (7.9.8.1.264)	Recycling and sputtering coefficients for each impurity ion in desc_impur. Array(nimp). Time-dependent.
codeparam	codeparam (7.9.8.1.105)	Code parameters
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar

7.9.8.1.33 coreprof

Core plasma 1D profiles as a function of the toroidal flux coordinate, obtained by solving the core transport equations (can be also fitted profiles from experimental data). The codeparam element here describes the parameters of the transport equation solver and/or those of the fitting program. Time-dependent CPO.

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
rho_tor_norm	vecflt_type (7.9.8.1.18)	Normalised toroidal flux coordinate values (= rho_tor normalised to the value at the last radial grid point, which is quasi at the Last Closed Flux Surface); Time-dependent; Vector (nrho)
rho_tor	vecflt_type (7.9.8.1.18)	Toroidal flux coordinate (not normalised, equivalent to rho_tor_norm) [m]; Vector (nrho). Time-dependent.
drho_dt	vecflt_type (7.9.8.1.18)	Time derivative of rho_tor [m/s]; Vector (nrho). Time-dependent.
toroid_field	toroid_field (7.9.8.1.487)	Toroidal field information entering the definition of rho_tor, for reference only. The physical value of the toroidal field should be taken from the toroidfield CPO. Time-dependent.
composition	composition (7.9.8.1.123)	Plasma composition (description of ion species). OBSOLESCENT.
desc_impur	desc_impur (7.9.8.1.164)	Description of the impurities (list of ion species and possibly different charge states). OBSOLESCENT.
compositions	compositions_type (7.9.8.1.127)	Contains all the composition information for the simulation (main ions, impurities, neutrals, edge species).
psi	psi (7.9.8.1.369)	Poloidal magnetic flux [Wb]; Time-dependent;
te	corefield (7.9.8.1.135)	Electron temperature [eV]; (source term in [W.m^-3]). Time-dependent;
ti	corefieldion (7.9.8.1.136)	Ion temperature [eV]; (source term in [W.m^-3]). Time-dependent;
ne	corefield (7.9.8.1.135)	Electron density [m^-3]; (source term in [m^-3]).Time-dependent;
ni	corefieldion (7.9.8.1.136)	Ion density [m^-3]; (source term in [m^-3]). Time-dependent;
vtor	corefieldion (7.9.8.1.136)	Toroidal velocity of the various ion species [m.s^-1]; Time-dependent;
profiles1d	profiles1d (7.9.8.1.367)	Profiles derived from the fields solved in the transport equations, or from experiment.
globalparam	globalparam (7.9.8.1.257)	Various global quantities calculated from the 1D profiles. Time-dependent
codeparam	codeparam (7.9.8.1.105)	Code parameters
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar

7.9.8.1.34 coresource

Generic source term for the core transport equations (radial profile). Time-dependent CPO.

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
composition	composition (7.9.8.1.123)	Plasma composition (description of ion species). OBSOLESCENT.
desc_impur	desc_impur (7.9.8.1.164)	Description of the impurities (list of ion species and possibly different charge states). OBSOLESCENT.
compositions	compositions_type (7.9.8.1.127)	Contains all the composition information for the simulation (main ions, impurities, neutrals, edge species).

member	type	description
toroid_field	b0r0 (7.9.8.1.82)	Characteristics of the vacuum toroidal field, redundant with the toroidfield CPO, to document the normalisation of rho and j in this CPO.
values(:)	coresource_values (7.9.8.1.153)	Description of the source terms of various origins. Array of structure (nsource). Time-dependent.
codeparam	codeparam (7.9.8.1.105)	Code parameters
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar

7.9.8.1.35 coretransp

Generic transport coefficients for the core transport equations (radial profile). Time-dependent CPO

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
composition	composition (7.9.8.1.123)	Plasma composition (description of ion species). OBSOLESCENT.
desc_impur	desc_impur (7.9.8.1.164)	Description of the impurities (list of ion species and possibly different charge states). OBSOLESCENT.
compositions	compositions_type (7.9.8.1.127)	Contains all the composition information for the simulation (main ions, impurities, neutrals, edge species).
values(:)	coretransp_values (7.9.8.1.157)	Description of transport term coming from various origins. Array of structure (ntransp). Time-dependent
codeparam	codeparam (7.9.8.1.105)	Code parameters
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar

7.9.8.1.36 cxdiag

Charge Exchange Diagnostic; Time-dependent CPO

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
setup	cxsetup (7.9.8.1.160)	diagnostic setup information
measure	cxmeasure (7.9.8.1.159)	Measured values
codeparam	codeparam (7.9.8.1.105)	Code parameters
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar

7.9.8.1.37 distribution

Datastructure for representing data associated with a distribution function one or many particle species. This structure is specifically designed to handle non-Maxwellian distribution function generated during heating and current drive, typically solved using a Fokker-Planck calculation perturbed by a heating scheme (e.g. IC, EC, LH, NBI, or alpha heating) and then relaxed by Coloumb collisions. Time-dependent CPO

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
composition	composition (7.9.8.1.123)	Plasma composition (description of ion species). OBSOLESCENT.
compositions	compositions_type (7.9.8.1.127)	Contains all the composition information for the simulation (main ions, impurities, neutrals, edge species).
distri_vec(:)	distri_vec (7.9.8.1.194)	Vector over all distribution functions. Every distribution function has to be associated with only one particle species, specifiec in distri_vec/species/, but there could be multiple distribution function for each species. In this case, the fast particle populations should be superposed. Time-dependent. Structure array(ndistri_vec)
codeparam	codeparam (7.9.8.1.105)	Code parameters
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar

7.9.8.1.38 distsource

Sources of particles for input to kinetic equations, e.g. Fokker-Planck calculation. The sources could originate from e.g. NBI or fusion reactions. Time-dependent CPO

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
composition	composition (7.9.8.1.123)	Plasma composition (description of ion species). OBSOLESCENT.
compositions	compositions_type (7.9.8.1.127)	Contains detailed information on the plasma composition (main ions, impurities, neutrals, edge species).

member	type	description
source(:)	distsource_source (7.9.8.1.199)	Source. Time-dependent. Structure array(nsrc_spec)
codeparam	codeparam (7.9.8.1.105)	Code parameters
time	float (7.9.8.1.2)	Time [s]; Time-dependent; scalar

7.9.8.1.39 ecediag

Electron Cyclotron Emission Diagnostic; Time-dependent CPO

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
setup	ecesetup (7.9.8.1.203)	diagnostic setup information
measure	ecemeasure (7.9.8.1.202)	Measured values
codeparam	codeparam (7.9.8.1.105)	Code parameters
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar

7.9.8.1.40 edge

CPO for edge/SOL plasma description. Time-dependent CPO

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
grid	complexgrid (7.9.8.1.110)	Grid description
species(:)	species_desc (7.9.8.1.438)	Description of ion species. Array of structures(nspecies)
compositions	compositions_type (7.9.8.1.127)	Contains all the composition information for the simulation (main ions, impurities, neutrals, edge species).
fluid	edge_fluid (7.9.8.1.204)	Fluid description of edge plasma. Time-dependent.
kinetic	edge_kinetic (7.9.8.1.210)	Kinetic description of edge plasma. Time-dependent.
codeparam	codeparam (7.9.8.1.105)	Code parameters
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar

7.9.8.1.41 efcc

Error field correction coils. Time-dependent CPO.

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
coil(:)	coil (7.9.8.1.108)	Individual coil. Time-dependent. Structure array. Replicate this coil structure for coil element in the efcc array.
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar
codeparam	codeparam (7.9.8.1.105)	Code parameters

7.9.8.1.42 equilibrium

Description of a 2D, axi-symmetric, tokamak equilibrium; result of an equilibrium code. Time-dependent CPO

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
eqconstraint	eqconstraint (7.9.8.1.217)	measurements to constrain the equilibrium, output values and accuracy of the fit
eqgeometry	eqgeometry (7.9.8.1.218)	Geometry of the plasma boundary
flush	flush (7.9.8.1.231)	FLUSH package coefficients for the mapping of the equlibrium. The time grid of this structure is the same as the equilibrium structure above.
global_param	global_param (7.9.8.1.256)	0d output parameters
profiles_1d	profiles_1d (7.9.8.1.368)	output profiles as a function of the poloidal flux
profiles_2d(:)	equilibrium_profiles_2d (7.9.8.1.223)	Output profiles in the poloidal plane. Time-dependent
coord_sys	coord_sys (7.9.8.1.129)	flux surface coordinate system on a square grid of flux and angle
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar
codeparam	codeparam (7.9.8.1.105)	Code parameters

7.9.8.1.43 fusiondiag

Fusion product diagnostics; Time-dependent CPO

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
fus_product(:)	fusiondiag_fus_product (7.9.8.1.250)	Source. Time-dependent. Structure array. Replicate this source structure to accommodate neutron and gammas.
codeparam	codeparam (7.9.8.1.105)	Code parameters
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar

7.9.8.1.44 halphadiag

H/D alpha line integrated diagnostic; Time-dependent CPO

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
setup	halpha_setup (7.9.8.1.258)	setup for the lines of sight of the line integrated measurement
intensity	exp1D (7.9.8.1.225)	Measured light intensity (a.u.). Time-dependent. Vector (nlos)
codeparam	codeparam (7.9.8.1.105)	Code parameters
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar

7.9.8.1.45 heat_sources

Description of a set of heat sources or sinks. Time-dependent CPO.

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
sources(:)	calorimetry_heat_source (7.9.8.1.101)	Heat sources. Array of structure (nheat_source)
sinks(:)	calorimetry_heat_source (7.9.8.1.101)	Heat sinks. Array of structure (nheat_sink)
codeparam	codeparam (7.9.8.1.105)	Code parameters
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar

7.9.8.1.46 interfdiag

General line integral diagnostic

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
expression	string (7.9.8.1.4)	Formal expression for the line integral to be evaluated as a function of ne, ni, Te, Ti, Zeff, Br, Bz
setup_line	setup_line (7.9.8.1.424)	Geometric description of the lines of sight
measure	exp1D (7.9.8.1.225)	Measured value. Time-dependent; Vector (nchords)
codeparam	codeparam (7.9.8.1.105)	Code parameters
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar

7.9.8.1.47 ironmodel

Model of the iron circuit; Time-dependent CPO

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
desc_iron	desc_iron (7.9.8.1.165)	Description of the iron segments
magnetise	magnetise (7.9.8.1.288)	Magnetisation M of the iron segment, assumed to be constant inside a given iron segment. Reminder : H = 1/mu0 * B - mur * M; [A/m].
codeparam	codeparam (7.9.8.1.105)	Code parameters
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar

7.9.8.1.48 langmuirdiag

Langmuir probes; Time-dependent CPO

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
potential	lang_measure (7.9.8.1.272)	Floating potential [V]. All children are vectors(npot)
bias	lang_measure (7.9.8.1.272)	Biasing potential [V]. All children are vectors(bias)
jsat	lang_measure (7.9.8.1.272)	Ion saturation current [A/m^2]. All children are vectors(njsat)
ne	lang_derived (7.9.8.1.271)	Electron density [m^-3]. All children are vectors(ndensity).
te	lang_derived (7.9.8.1.271)	Electron Temperature [eV]. All children are vectors(nte)
machpar	lang_derived (7.9.8.1.271)	Parallel Mach number. All children are vectors(nmach)
codeparam	codeparam (7.9.8.1.105)	Code parameters
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar

7.9.8.1.49 launchs

RF wave launch conditions. Time-dependent CPO

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
name	vecstring_type (7.9.8.1.20)	Antenna name, Vector of strings (nantenna)
type	vecstring_type (7.9.8.1.20)	Wave type (LH, EC, IC, ...), Vector of strings (nantenna)
frequency	vecflt_type (7.9.8.1.18)	Wave frequency [Hz], Vector (nantenna).
mode	vecint_type (7.9.8.1.19)	Incoming wave mode (+ 1 : slow wave only; -1 both slow and fast wave modes). Vector of integers (nantenna). Time-dependent
position	rzphi1D (7.9.8.1.393)	Reference global position of the antenna. Time-dependent
spectrum	spectrum (7.9.8.1.441)	Spectral properties of the wave.
beam	launchs_rfbeam (7.9.8.1.276)	Beam characteristics
codeparam	codeparam (7.9.8.1.105)	Code parameters
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar

7.9.8.1.50 lithiumdiag

Lithium Beam Diagnostic; Time-dependent CPO

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
setup	lithsetup (7.9.8.1.284)	diagnostic setup information
measure	lithmeasure (7.9.8.1.283)	Measured values
codeparam	codeparam (7.9.8.1.105)	Code parameters
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar

7.9.8.1.51 magdiag

Magnetic diagnostics. Time-dependent CPO

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
ip	exp0D (7.9.8.1.224)	Plasma current [A]. Positive sign means anti-clockwise when viewed from above. Time-dependent. Scalar
diamagflux	exp0D (7.9.8.1.224)	Diamagnetic flux [Wb]; Time-dependent; Scalar
diamagener	exp0D (7.9.8.1.224)	Diamagnetic energy [J]; Time-dependent; Scalar
flux_loops	flux_loops (7.9.8.1.232)	Poloidal flux loops RZ coordinates have 1 component for the full loop and two if there is a negative reference loop
bpol_probes	bpol_probes (7.9.8.1.98)	Poloidal field probes
codeparam	codeparam (7.9.8.1.105)	Code parameters
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar

7.9.8.1.52 mhd

MHD linear stability. Time-dependent CPO

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
toroid_field	b0r0 (7.9.8.1.82)	Characteristics of the vacuum toroidal field, redundant with the toroidfield CPO, to document the normalisation of rho and j in this CPO.

member	type	description
n(:)	mhd_mode (7.9.8.1.292)	Vector of toroidal mode numbers; Structure Array (ntor); Time-dependent
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar.
codeparam	codeparam (7.9.8.1.105)	Code parameters

7.9.8.1.53 msediag

MSE Diagnostic; Time-dependent CPO

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
polarimetry	polarimetry (7.9.8.1.362)	This structure accomodates the polarimetry setup and measurements of a mse diagnostic, as widely used in fusion devices. The final measurement is the tan(gamma) where gamma is the polarization angle of a particular spectral mse component.
spectral	spectral (7.9.8.1.440)	This structure accommodates the types needed on a spectral MSE diagnostic namely the emmissivity and the radiance spectra. It will be subsequenty upgraded with optical + photon detection elements since the structure will also be used for a synthetic spectral mse code.
codeparam	codeparam (7.9.8.1.105)	Code parameters
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar

7.9.8.1.54 nbi

Neutral Beam Injection. Input to NBI source codes; describes the neutrals that are about to be launched into the torus; Time-dependent CPO

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
nbi_unit(:)	nbi_unit (7.9.8.1.314)	Vector of Neutral Beam Injector units. The NBI system should be separated in to the individually power strucutres. Structure array(nunits). Time-dependent
codeparam	codeparam (7.9.8.1.105)	Code parameters
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar

7.9.8.1.55 neoclassic

Neoclassical quantities (including transport coefficients). Time-dependent CPO

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
rho_tor_norm	vecflt_type (7.9.8.1.18)	Normalised toroidal flux coordinate values (= rho_tor normalised to the value at the last grid point); Vector (nrho)
rho_tor	vecflt_type (7.9.8.1.18)	Toroidal flux coordinate (not normalised, equivalent to rho_tor_norm) [m]; Vector (nrho). Time-dependent.
composition	composition (7.9.8.1.123)	Plasma composition (description of ion species). OBSOLESCENT.
desc_impur	desc_impur (7.9.8.1.164)	Description of the impurities (list of ion species and possibly different charge states). OBSOLESCENT.
compositions	compositions_type (7.9.8.1.127)	Contains all the composition information for the simulation (main ions, impurities, neutrals, edge species).
ni_neo	transcoefion (7.9.8.1.491)	Neoclassical transport coefficients for ion density equation. Time-dependent.
ne_neo	transcoefel (7.9.8.1.489)	Neoclassical transport coefficients for electron density equation. Time-dependent.
nz_neo(:)	transcoefimp (7.9.8.1.490)	Neoclassical transport coefficients for impurity (multiple charge state) density equation. Time-dependent.
ti_neo	transcoefion (7.9.8.1.491)	Neoclassical transport coefficients for ion temperature equation. Time-dependent.
te_neo	transcoefel (7.9.8.1.489)	Neoclassical transport coefficients for electron temperature equation. Time-dependent.
tz_neo(:)	transcoefimp (7.9.8.1.490)	Neoclassical transport coefficients for impurity (multiple charge state) temperature equation. Time-dependent.
mtor_neo	transcoefel (7.9.8.1.489)	Neoclassical transport coefficients for total toroidal momentum equation. Time-dependent.
sigma	vecflt_type (7.9.8.1.18)	Neoclassical conductivity [ohm^-1.m^-1]. Time-dependent. Vector(nrho).
jboot	vecflt_type (7.9.8.1.18)	Bootstrap current density [A.m^-2]. Time-dependent. Vector(nrho).
er	vecflt_type (7.9.8.1.18)	Radial electric field [V/m]. Time-dependent. Vector(nrho).
vpol	matflt_type (7.9.8.1.15)	Neoclassical poloidal rotation of each ion species [m/s]. Time-dependent. Matrix(nrho,nion).
vtor	matflt_type (7.9.8.1.15)	Neoclassical toroidal rotation of each ion species [m/s]. Time-dependent. Matrix(nrho,nion).
mach	matflt_type (7.9.8.1.15)	Mach number of each ion species. Time-dependent. Matrix(nrho,nion).
utheta_e	vecflt_type (7.9.8.1.18)	Electron poloidal flow [m/s]. Time-dependent. Vector(nrho).
utheta_i	matflt_type (7.9.8.1.15)	Ion poloidal flow [m/s]. Time-dependent. Matrix(nrho,nion).
viscosity_par	matflt_type (7.9.8.1.15)	Ion parallel viscosity [?]. Time-dependent. Matrix(nrho,nion).

member	type	description
impurity(:)	neoclassic_impurity (7.9.8.1.316)	Array(nimp). Time-dependent
fext	array3dflt_type (7.9.8.1.7)	Moments of parallel external force on each ion species [T.J.m^-3]. Time-dependent. Array3D(nrho,nion,nmoment).
jext	vecflt_type (7.9.8.1.18)	Current density response to fext [A.m^-2]. Time-dependent. Vector(nrho).
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar.
codeparam	codeparam (7.9.8.1.105)	Code parameters

7.9.8.1.56 ntm

Description of a Neoclassical Tearing Mode and its evolution.Time-dependent CPO

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
mode(:)	ntm_mode (7.9.8.1.321)	List of the various NTM modes appearing during the simulation. If a given (m,n) mode appears several times, use the "event" index of onset and full_evol to describe every occurence of the mode. All descendant nodes are marked as Time-dependent for technical reasons, to allow the size of the mode AoS to vary.
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar.
codeparam	codeparam (7.9.8.1.105)	Code parameters

7.9.8.1.57 orbit

Orbits for a set of particles. Time-dependent CPO

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
com	com (7.9.8.1.109)	COM (Constants Of Motion) parameters identifying an orbit
trace	trace (7.9.8.1.488)	Position of particle in 5D space (3D in real and 2D in velocity).
global_param	orbit_global_param (7.9.8.1.332)	Global quantities associated with an orbit.
codeparam	codeparam (7.9.8.1.105)	Code parameters
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar

7.9.8.1.58 pellets

Description of pellets. Time-dependent CPO.

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
compositions	compositions_type (7.9.8.1.127)	Pellet composition
pellet(:)	pellet (7.9.8.1.340)	Description of the pellets entering the plasma at given time. Array of structures (NPEL). Time-dependent.
codeparam	codeparam (7.9.8.1.105)	Code parameters
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar

7.9.8.1.59 pfsystems

Description of the active poloidal coils, passive conductors, currents flowing in those and mutual electromagnetic effects of the device; Time-dependent CPO

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
pfcoils	pfcoils (7.9.8.1.350)	Active poloidal field coils
pfpassive	pfpassive (7.9.8.1.354)	Passive axisymmetric conductor description
pfcircuits	pfcircuits (7.9.8.1.349)	Circuits, connected to multiple coils and to multiple supplies, defining the current and voltage relationships in the system
pfsupplies	pfsupplies (7.9.8.1.356)	PF power supplies
codeparam	codeparam (7.9.8.1.105)	Code parameters
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar

7.9.8.1.60 polardiag

General line integral diagnostic

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
expression	string (7.9.8.1.4)	Formal expression for the line integral to be evaluated as a function of ne, ni, Te, Ti, Zeff, Br, Bz
setup_line	setup_line (7.9.8.1.424)	Geometric description of the lines of sight
measure	exp1D (7.9.8.1.225)	Measured value. Time-dependent; Vector (nchords)
codeparam	codeparam (7.9.8.1.105)	Code parameters
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar

7.9.8.1.61 power_conv

Power conversion system. Time-dependent CPO.

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
cycle_type	string (7.9.8.1.4)	Type of cycle. String
circuits(:)	circuits (7.9.8.1.102)	Description of the circuit of the power conversion system. Array of structure. (ncircuits).
power_recirc	float (7.9.8.1.2)	Recirculated electric power (input to the power conversion actor). [W] Scalar
power_net	float (7.9.8.1.2)	Net electric power generated [W]. Scalar
power_int	float (7.9.8.1.2)	Total electric power consumption of the power conversion system.[W]. Scalar
efficiency	float (7.9.8.1.2)	Efficiency of the reactor (ratio of the alternator electrical power to the total power needed to operate the reactor)
codeparam	codeparam (7.9.8.1.105)	Code parameters
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar

7.9.8.1.62 reflectomet

Reflectometry CPO, contains antennas and received signals; Time-dependent CPO.

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
refl_receive(:)	refl_receive (7.9.8.1.377)	Reflectometry signal; experimental or code output. Time-dependent. Vector(nreceivers); If output from ERC3D, contains short, high-resolution (ps) time series anchored to the time of the CPO or, for a combination of runs, longer, coarse time signals. For experimental signals, time series may span much longer durations. For slowly varying signals, may contain only one point and have a seperate CPO instance with different time field for every point. For code output, the signals are usually normalised to unity power.
antennas(:)	reflectometry_antennas (7.9.8.1.378)	Vector of reflectometry antenna descriptions. These include radiation fields as well as material antenna structures (feeds, horns, later mirrors); Vector(nantennas); refl_received entries refer to their antenna by index in this array. Time-dependent.
codeparam	codeparam (7.9.8.1.105)	Code parameters
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar

7.9.8.1.63 rfadiag

Retarding field analyser Diagnostic; Time-dependent CPO

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
setup	rfasetup (7.9.8.1.384)	diagnostic setup information
measure	rfameasure (7.9.8.1.383)	Measured values
codeparam	codeparam (7.9.8.1.105)	Code parameters
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar

7.9.8.1.64 sawteeth

Description of sawtooth events. Time-dependent CPO

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
crash_trig	integer (7.9.8.1.3)	Flag indicating whether a crash condition has been satisfied : 0 = no crash. N(¿0) = crash triggered due to condition ii=N. Integer. Time-dependent.

member	type	description
composition	composition (7.9.8.1.123)	Plasma composition (description of ion species). OBSOLESCENT.
rho_tor_norm	vecflt_type (7.9.8.1.18)	Normalised toroidal flux coordinate values (= rho_tor normalised to the value at the last grid point); Vector (nrho)
rho_tor	vecflt_type (7.9.8.1.18)	Toroidal flux coordinate [m] given by sqrt(phi/B0/pi), where B0 = toroidfield%bvac_r%value / toroidfield%r0. Vector (nrho). Time-dependent.
profiles1d	sawteeth_profiles1d (7.9.8.1.400)	Core profiles after sawtooth crash
diags	sawteeth_diags (7.9.8.1.399)	NO DOCS
codeparam	codeparam (7.9.8.1.105)	Code parameters
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar

7.9.8.1.65 scenario

Scenario characteristics, to be used as input or output of a whole discharge simulator. Time-dependent CPO.

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
centre	scenario_centre (7.9.8.1.401)	central values of the profiles (at magnetic axis)
composition	scenario_composition (7.9.8.1.402)	Plasma composition (description of ion species).
configs	scenario_configuration (7.9.8.1.403)	Strings describing the tokamak configuration
confinement	scenario_confinement (7.9.8.1.404)	characteristic confinement times
currents	scenario_currents (7.9.8.1.405)	data related to current sources and current diffusion
edge	scenario_edge (7.9.8.1.406)	edge value (@ LCMS)
energy	scenario_energy (7.9.8.1.407)	plasma energy content
eqgeometry	eqgeometry (7.9.8.1.218)	Geometry of the plasma boundary
global_param	scenario_global (7.9.8.1.408)	Global scalar values
heat_power	scenario_heat_power (7.9.8.1.409)	Power delivred to plasma (thermal and non thermal)
itb	scenario_itb (7.9.8.1.411)	Values characteristics of the Internal Transport Barrier
lim_div_wall	scenario_lim_div_wall (7.9.8.1.412)	values on the plate of divertor or on the limitor or on the wall (@ LCMS)
line_ave	scenario_line_ave (7.9.8.1.413)	line averaged value
neutron	scenario_neutron (7.9.8.1.414)	neutron flux for DD and DT reactions
ninety_five	scenario_ninety_five (7.9.8.1.415)	values at 95% of poloidal flux
pedestal	scenario_pedestal (7.9.8.1.416)	Values at the top of the H-mode pedestal
references	scenario_references (7.9.8.1.419)	References
reactor	scenario_reactor (7.9.8.1.417)	reactor data (such as electricity cost ...)
sol	scenario_sol (7.9.8.1.420)	SOL characteristic (@ LCMS)
vol_ave	scenario_vol_ave (7.9.8.1.421)	volume averaged value
codeparam	codeparam (7.9.8.1.105)	Code parameters
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar

7.9.8.1.66 solcurdiag

SOL current diagnostic. Time-dependent CPO

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
sol_current(:)	solcurdiag_sol_current (7.9.8.1.429)	Vector of toroidal rings of divertor tiles. Structure array(nrings). Time-dependent
clusters(:)	clusters (7.9.8.1.104)	Cluster of tile rings to define and reference superset structures using the individual tile rings. A coil ring can coexist on two top level structures. Structure array (ncluster).
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar
codeparam	codeparam (7.9.8.1.105)	Code parameters

7.9.8.1.67 temporary

Storage of undeclared data model components; Time-dependent CPO

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
non_timed	temporary_nt (7.9.8.1.451)	Time-independent quantities (parameters)
timed	temporary_t (7.9.8.1.467)	Time-dependent quantities
codeparam	codeparam (7.9.8.1.105)	Code parameters
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar

7.9.8.1.68 topinfo

General info about the database entry. CPO.

member	type	description
dataprovider	string (7.9.8.1.4)	Name of the main data provider (the person who filled the original data)
description	string (7.9.8.1.4)	Pulse/Entry description
firstputdate	string (7.9.8.1.4)	Date of the original data submission
lastupdate	string (7.9.8.1.4)	Date of the last data addition in the tree
source	string (7.9.8.1.4)	Exact reference of the data source (e.g. original reference in the native machine data base)
comment	string (7.9.8.1.4)	Any additional comment
dataversion	string (7.9.8.1.4)	Version of the data structure
workflow	string (7.9.8.1.4)	Workflow which has been used to produce the present entry. Exact format to be defined with the platform group. User-specific input files (if allowed) must be stored there as well.
entry	entry_def (7.9.8.1.215)	Definition of this database entry
parent_entry	entry_def (7.9.8.1.215)	Definition of the entry of the direct parent (if any)
mdinfo	mdinfo (7.9.8.1.290)	Information related to machine description for this entry

7.9.8.1.69 toroidfield

Toroidal field. Time-dependent CPO

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
desc_tfcoils	tf_desc_tfcoils (7.9.8.1.482)	Description of the toroidal field coils
nturns	integer (7.9.8.1.3)	Number of total turns in the toroidal field coil
ncoils	integer (7.9.8.1.3)	Number of packets of coils
current	exp0D (7.9.8.1.224)	Current in the toroidal field coils [A]; Time-dependent. Scalar.
bvac_r	exp0D (7.9.8.1.224)	Vacuum field times radius in the toroidal field magnet [T.m]. Positive sign means anti-clockwise when viewed from above. Time-dependent. Scalar.
r0	float (7.9.8.1.2)	Characteristic major radius of the device (used in publications, usually middle of the vessel at the equatorial midplane) [m]. Scalar.
p_cryo	float (7.9.8.1.2)	Total electric power consumed by the cryoplant system [W]; Time-dependent. Scalar.
wp_nh_max	float (7.9.8.1.2)	Peak nuclear heating in winding pack [W*m^-3]. Time-dependent. Scalar
tfc_nh	float (7.9.8.1.2)	Nuclear heating on the toroidal field coils [W]; Time-dependent. Scalar
neut_flux_inb	float (7.9.8.1.2)	Neutron flux arriving at the inboard surface of the coil (on the plasma side) [neutron.s^-1.m^-2]; Time-dependent. Scalar.
neut_flux_outb	float (7.9.8.1.2)	Neutron flux arriving at the ouboard surface of the coil (on the plasma side) [neutron.s^-1.m^-2]; Time-dependent. Scalar.
codeparam	codeparam (7.9.8.1.105)	Code parameters
time	float (7.9.8.1.2)	Time [s]; Time-dependent. Scalar.

7.9.8.1.70 tsdiag

Thomson scattering Diagnostic; Time-dependent CPO

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
setup	tssetup (7.9.8.1.496)	diagnostic setup information
measure	tsmeasure (7.9.8.1.495)	Measured values
codeparam	codeparam (7.9.8.1.105)	Code parameters
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar

7.9.8.1.71 turbulence

Turbulence; Time-dependent CPO.

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
composition	turbcomposition (7.9.8.1.497)	Plasma composition (description of ion species).
coordsys	turbcoordsys (7.9.8.1.498)	Decription of the coordinates and metric used by the codes.
var0d	turbvar0d (7.9.8.1.502)	Diagnostic fast time traces.
var1d	turbvar1d (7.9.8.1.503)	Dependent variable radial profile.
var2d	turbvar2d (7.9.8.1.504)	Dependent variable axisymmetric.
var3d	turbvar3d (7.9.8.1.505)	Dependent variable morphology. Grid is defined in coord_sys/turbgrid.
var4d	turbvar4d (7.9.8.1.506)	Gyrokinetic distribution function, axisymmetric component. Grid is defined in coord_sys/turbgrid.
var5d	turbvar5d (7.9.8.1.507)	Gyrokinetic distribution function. Grid is defined in coord_sys/turbgrid.
spec1d	turbspec1d (7.9.8.1.501)	Toroidal mode number spectra.
env1d	turbenv1d (7.9.8.1.499)	Parallel fluctuation envelope.
codeparam	codeparam (7.9.8.1.105)	Code parameters
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar.

7.9.8.1.72 wall

General Wall representation. Time-dependent CPO.

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
wall0d	wall_wall0d (7.9.8.1.522)	Simple 0D description of plasma-wall interaction
wall2d_mhd	wall2d_mhd (7.9.8.1.510)	Simplified wall that encloses necessary information for RWM codes.
wall2d(:)	wall2d (7.9.8.1.509)	2D wall descriptions; Array of structures (number of wall descriptions). Replicate this element for each type of possible physics or engineering configurations necessary (gas tight vs wall with ports and holes, coarse vs fine representation, single contour limiter, disjoint gapped plasma facing components, ...). Time-dependent
wall3d(:)	wall3d (7.9.8.1.511)	3D wall descriptions; Array of structures (number of wall descriptions). Replicate this element for each type of possible physics or engineering configurations necessary (gas tight vs wall with ports and holes, coarse vs fine representation, ...). Time-dependent
wall_types(:)	wall_types (7.9.8.1.515)	List of reference wall types (e.g. bulk tungsten, tungsten-coated CFC, ...) ; Array of structures (number of reference wall types)
compounds(:)	compound_desc (7.9.8.1.128)	Chemical compounds (e.g. solid tungsten, WC, CFC, ...) possibly present in the wall. Array of structure (number of compounds)
elements(:)	element_desc (7.9.8.1.214)	Chemical elements present in the wall units, including elements from the plasma (gas + impurities). Use by compounds. Array of structures (number of elements)
compositions	compositions_type (7.9.8.1.127)	NO DOCS
codeparam	codeparam (7.9.8.1.105)	Code parameters
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar.

7.9.8.1.73 waves

RF wave propagation and deposition. Time-dependent CPO

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
coherentwave(:)	coherentwave (7.9.8.1.107)	Wave description for each frequency. Time-dependent. Structure array(nfreq)
codeparam	codeparam (7.9.8.1.105)	Code parameters
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar

7.9.8.1.74 Utility Structures

7.9.8.1.75 amns_constituentType

Contains all of the information to characterize an AMNS constituent.

member	type	description
label	string (7.9.8.1.4)	String identifier for reaction constituent (e.g. ”D”, ”C”).
zn	integer (7.9.8.1.3)	Number of protons in the nucleus (nuclear charge); 0 if none (e-, gamma)

member	type	description
mn	integer (7.9.8.1.3)	Number of nucleons in the nucleus (nuclear mass); 0 if none (e-, gamma); Not set if not important (e.g. for an atomic process that is not isotope dependent)
multiplicity	float (7.9.8.1.2)	Multiplicity in the compound

Type of: reacprodType:constituents (4475)

7.9.8.1.76 amns_processType

Contains all of the information to characterize an AMNS process; Vector(nprocs).

member	type	description
proc_label	string (7.9.8.1.4)	Label for process (e.g. EI, RC; could also include error estimates)
reactant(:)	reacprodType (7.9.8.1.372)	Array of reactants; Vector(nreac).
product(:)	reacprodType (7.9.8.1.372)	Array of products; Vector(nprod).
sup_string	vecstring_type (7.9.8.1.20)	String array to be used if supplementary information is required.
sup_real	vecflt_type (7.9.8.1.18)	Real array to be used if supplementary information is required.
sup_int	vecint_type (7.9.8.1.19)	Int array to be used if supplementary information is required.
quality	identifier (7.9.8.1.263)	Characterize the data quality
err_proc_label	string (7.9.8.1.4)	"proc_label" of an associated error table of the same type as the primary quantity

Type of: amns:process (4127)

7.9.8.1.77 antenna_ec

Vector of Electron Cyclotron antennas. Time-dependent

member	type	description
name	string (7.9.8.1.4)	Antenna name
frequency	float (7.9.8.1.2)	Frequency [Hz]
power	exp0D (7.9.8.1.224)	Power [W]; Time-dependent
mode	integer (7.9.8.1.3)	Incoming wave mode (+ or -1 for O/X mode); Time-dependent
position	rzphi0D (7.9.8.1.392)	Launching position in the global reference system; Time-dependent
launchangles	launchangles (7.9.8.1.273)	Launching angles of the beam
beam	rfbeam (7.9.8.1.385)	Beam characteristics at the launching position
codeparam	codeparam (7.9.8.1.105)	Code parameters

Type of: antennas:antenna_ec (4128)

7.9.8.1.78 antenna_ic

Vector of Ion Cyclotron antennas. Time-dependent

member	type	description
name	string (7.9.8.1.4)	Antenna name; String
frequency	exp0D (7.9.8.1.224)	Frequency [Hz]; Time-dependent; Exp0d
power	exp0D (7.9.8.1.224)	Power [W]; Time-dependent; Exp0d
ntor	vecint_type (7.9.8.1.19)	Toroidal mode numbers [-]; Time-dependent; Vector(n_ntor)
power_ntor	vecflt_type (7.9.8.1.18)	Power coupled in each toroidal mode [W]; Time-dependent; Vector(n_ntor)
setup	antennaic_setup (7.9.8.1.80)	Detailed description of IC antenna hardware and internal settings
codeparam	codeparam (7.9.8.1.105)	Code parameters

Type of: antennas:antenna_ic (4128)

7.9.8.1.79 antenna_lh

Vector of Lower Hybrid antennas. Time-dependent

member	type	description
name	string (7.9.8.1.4)	Antenna name, String
frequency	float (7.9.8.1.2)	Frequency [Hz]

member	type	description
power	exp0D (7.9.8.1.224)	Power [W]; Exp0d. Time-dependent
n_par	float (7.9.8.1.2)	Main parallel refractive index of the launched spectrum, for multi-junction antennas. Time-dependent
position	rzphi0D (7.9.8.1.392)	Reference global antenna position. Time-dependent
setup	antennalh_setup (7.9.8.1.81)	Detailed description of LH antennas.
plasmaedge	plasmaedge (7.9.8.1.360)	Plasma edge characteristics in front of the antenna.
beam	rfbeam (7.9.8.1.385)	Beam characteristics
codeparam	codeparam (7.9.8.1.105)	Code parameters

Type of: antennas:antenna_lh (4128)

7.9.8.1.80 antennaic_setup

Detailed description of an ICRH antenna; hardware and settings

member	type	description
straps(:)	straps (7.9.8.1.444)	Properties of the IC antenna strap; Time-dependent; Vector(nstraps)
current	current (7.9.8.1.158)	Description of the IC surface currents on the antenna straps and on passive components.

Type of: antenna_ic:setup (4181)

7.9.8.1.81 antennalh_setup

Detailed description of LH antennas

member	type	description
modules	modules (7.9.8.1.303)	Modules description. NB there are nmodules per antenna, distributed among nma_phi toroidal positions and nma_theta poloidal positions

Type of: antenna_lh:setup (4182)

7.9.8.1.82 b0r0

Characteristics of the vacuum toroidal field, redundant with the toroidfield CPO, normalisation used by the ETS

member	type	description
r0	float (7.9.8.1.2)	Characteristic major radius of the device (used in publications, usually middle of the vessel at the equatorial midplane) [m]. Scalar.
b0	float (7.9.8.1.2)	Vacuum field at r0 [T]; Positive sign means anti-clockwise when viewed from above. Scalar. Time-dependent.

Type of: corefast:toroid_field (4134) I coresource:toroid_field (4138) I dist_geometry_0d:toroid_field (4278) I dist-source_global_param:toroid_field (4298) I global_param:toroid_field (4359) I mhd:toroid_field (4156) I waves_global_param:to (4629)

7.9.8.1.83 bb

Breeding blanket

member	type	description
nb_bb	float (7.9.8.1.2)	Total (in the reactor) number of breeding blanket module; Scalar
nb_bb_polcut	float (7.9.8.1.2)	Number of bb modules on a poloidal cut; Scalar
teta_bb	float (7.9.8.1.2)	Angle (0 for equatorial outboard, then in anti-clokwise direction) of bb module; [deg]
tbr	float (7.9.8.1.2)	Tritium breeding ratio of the blanket [-]; Scalar
neutro_resul	neutro_resul (7.9.8.1.319)	Neutronic results
inboard	bb_specs (7.9.8.1.86)	Inboard
outboard	bb_specs (7.9.8.1.86)	Outboard

Type of: bb_shield:bb (4129)

7.9.8.1.84 bb_dimension

dimension of the various modules

member	type	description
radial	vecflt_type (7.9.8.1.18)	Radial dimension [m]. Vector(nmodules)
toroidal	vecflt_type (7.9.8.1.18)	Toroidal dimension [m]. Vector(nmodules)
poloidal	vecflt_type (7.9.8.1.18)	Poloidal dimension [m]. Vector(nmodules)

Type of: bb_geometry:bot_cap_dim (4188) I bb_geometry:top_cap_dim (4188) I bb_specs:dimension (4189)

7.9.8.1.85 bb_geometry

Geometrical parameters of "the" reference outboard blanket module

member	type	description
dr_fw	float (7.9.8.1.2)	Radial thickness of the FW [m]; Scalar
dr_bz	float (7.9.8.1.2)	Radial thickness of the BZ (between the FW and the 1st back plate wall) [m]; Scalar
dr_bp	float (7.9.8.1.2)	Radial thickness of the BPs integrated to the module [m]; Scalar
dr_bp_plates	vecflt_type (7.9.8.1.18)	Radial thickness of every BP integrated to the module [m]; Vector(nplates)
dr_bp_he	vecflt_type (7.9.8.1.18)	Radial thickness of Helium layers [m]; Vector(nplates)
dr_man	float (7.9.8.1.2)	Radial thickness of the banana manifold common to all modules [m]; Scalar
dt_sw	float (7.9.8.1.2)	Toroidal thickness of side walls (or covers) [m]; Scalar
dt_bz	float (7.9.8.1.2)	Toroidal dimension of the BZ (between the two side walls [m]; Scalar
dp_bz	float (7.9.8.1.2)	Poloidal dimension of the Breeder zone [m]; Scalar
top_cap_dim	bb_dimension (7.9.8.1.84)	Top cap dimension of bb modules
bot_cap_dim	bb_dimension (7.9.8.1.84)	Bottom cap dimension of bb modules
a_fw_ch	float (7.9.8.1.2)	First wall channel radial dimension [m]; Scalar
b_fw_ch	float (7.9.8.1.2)	First wall channel toroidal dimension [m]; Scalar
td_tc_ch	float (7.9.8.1.2)	Top cap channel toroidal dimension [m]; Scalar
rd_tc_ch	float (7.9.8.1.2)	Top cap channel radial dimension [m]; Scalar
td_bc_ch	float (7.9.8.1.2)	Bottom cap channel toroidal dimension [m]; Scalar
rd_bc_ch	float (7.9.8.1.2)	Bottom cap channel radial dimension [m]; Scalar
n_fw_ch	float (7.9.8.1.2)	Number of first wall channels; Scalar
n_fw_circ	float (7.9.8.1.2)	Number of circulation in channel first wall channels; Scalar
a_sg_ch	float (7.9.8.1.2)	Stiffening grid channel dimension 1 [m]; Scalar
b_sg_ch	float (7.9.8.1.2)	Stiffening grid channel dimension 2 [m]; Scalar
n_sg_ch	float (7.9.8.1.2)	Number of channels per stiffening plate [m]; Scalar
sg_thick	float (7.9.8.1.2)	Stiffening grid thickness [m]; Scalar
sg_weld	float (7.9.8.1.2)	Stiffening grid required dimension for welding [m]; Scalar
sg_in_out	float (7.9.8.1.2)	Stiffening grid input/output geometry length [m]; Scalar
r_sg_cp	float (7.9.8.1.2)	Percentage of the cooling plate length [-]; Scalar
cp_tor_gap	float (7.9.8.1.2)	Gap between cooling plates and toroidal breeder [m]; Scalar
a_cp_ch	float (7.9.8.1.2)	Cooling plates channel dimension 1 [m]; Scalar
b_cp_ch	float (7.9.8.1.2)	Cooling plates channel dimension 2 [m]; Scalar
n_cp_ch	float (7.9.8.1.2)	Number of channels per cooling plates [m]; Scalar
cp_thick	float (7.9.8.1.2)	Cooling plates thickness [m]; Scalar
n_pol_bu	float (7.9.8.1.2)	Number of poloidal breeder units; Scalar
n_tor_bu	float (7.9.8.1.2)	Number of toroidal breeder units; Scalar
n_cp_bu	float (7.9.8.1.2)	Number of cooling plates per breeder unit; Scalar
cp_in_out	float (7.9.8.1.2)	Cooling plate input/output geometry length [m]; Scalar
he_man_tck	float (7.9.8.1.2)	Helium stage manifold thickness [m]; Scalar
man_tck	float (7.9.8.1.2)	Manifold zone thickness [m]; Scalar
pbli_bptb_od	float (7.9.8.1.2)	Output diameter of pbli tube [m]; Scalar
pbli_bptb_id	float (7.9.8.1.2)	Input diameter of pbli tube [m]; Scalar
he_bptb_od	float (7.9.8.1.2)	Output diameter of He inlet tube [m]; Scalar
he_bptb_id	float (7.9.8.1.2)	Input diameter of He inlet tube [m]; Scalar
dr_max_fw	float (7.9.8.1.2)	First wall frontmost thickness [m]; Scalar
dr_fwpl	float (7.9.8.1.2)	Radial thickness of fisrt protective layer [m]; Scalar

Type of: hcllbb_specs:mod_geom (4364)

7.9.8.1.86 bb_specs

Inboard

member	type	description
nbb	float (7.9.8.1.2)	Number of inboard or outboard bb modules (in a poloidal cut), Scalar
r1	float (7.9.8.1.2)	Inner radius (nearest to the plasma), in the global tokamak coordinate system of the inboard or outboard bb located at the equatorial plane [m]; Scalar
r2	float (7.9.8.1.2)	Outer radius (farest to the plasma), in the global tokamak coordinate system of the inboard or outboard bb located at the equatorial plane [m]; Scalar
dimension	bb_dimension (7.9.8.1.84)	dimension of the various modules

Type of: bb:inboard (4186) I bb:outboard (4186)

7.9.8.1.87 beamletgroup

Group of beamlets with common vertical and horizontal focal point. If there are no common focal points, then select small groups of beamlets such that a focal point description of the beamlet-group provides a fair description.

member	type	description
position	rzphi0D (7.9.8.1.392)	Position of centre of injection unit surface (or grounded grid).
tang_rad	float (7.9.8.1.2)	Tangency radius (major radius where the central line of a NBI unit is tangent to a circle around the torus) [m]
angle	float (7.9.8.1.2)	Angle of inclination between a line at the centre of the injection unit surface and the horiontal plane [rad]
direction	integer (7.9.8.1.3)	Direction of the beam seen from above the torus: -1 = clockwise; 1 = counter clockwise
width_horiz	float (7.9.8.1.2)	Horizontal width of the beam group at the injection unit surface (or grounded grid) [m]
width_vert	float (7.9.8.1.2)	Vertical width of the beam group at the injection unit surface (or grounded grid) [m]
focussing	focussing (7.9.8.1.236)	Describes how the beam is focussed.
divergence	divergence (7.9.8.1.200)	Detailed information on beamlet divergence. Divergens is described as a super position of Gaussian profiles with amplitide "frac_divcomp" and vertical/horizontal divergence "div_vert"/"div_horiz". Note that for positive ion NBI the divergence is well described by a single Gaussian.
beamlets	beamlets (7.9.8.1.88)	Detailed information on beamlets.

Type of: nbi_unit:beamletgroup (4417)

7.9.8.1.88 beamlets

Detailed information on beamlets.

member	type	description
position	rzphi1D (7.9.8.1.393)	Position of beamlets. Vector rzphi1D (nbeamlets)
tang_rad_blt	vecflt_type (7.9.8.1.18)	Tangency radius (major radius where the central line of a beamlet is tangent to a circle around the torus) [m]; Vector(nbeamlets)
angle_blt	vecflt_type (7.9.8.1.18)	Angle of inclination between a line at the centre of a beamlet and the horiontal plane [rad]; Vector(nbeamlets)
pow_frc_blt	vecflt_type (7.9.8.1.18)	Fraction of power of a unit injected by a beamlet; Vector(nbeamlets)

Type of: beamletgroup:beamlets (4190)

7.9.8.1.89 beamtracing

Beam-tracing or ray-tracing solver. Vector(nbeams). Time-dependent

member	type	description
npoints	integer (7.9.8.1.3)	Number of points along each ray/beam. Integer
power	float (7.9.8.1.2)	Initial power in each ray/beam [W]. Float. Time-dependent
dnpar	vecflt_type (7.9.8.1.18)	Spectral width in refractive index associated with each ray/beam, Vector (npoints). Time-dependent
length	vecflt_type (7.9.8.1.18)	Ray/beam curvilinear length [m], Vector (npoints). Time-dependent
position	waves_rtposition (7.9.8.1.531)	Ray/beam position
wavevector	waves_rtwavevector (7.9.8.1.532)	Ray/beam wave vector.

member	type	description
polarization	polarization (7.9.8.1.363)	Wave field polarization along the ray/beam.
powerflow	powerflow (7.9.8.1.366)	Power flow along the ray/beam.

Type of: coherentwave:beamtracing (4210)

7.9.8.1.90 bolometer_measure

Measured values

member	type	description
prad	exp1D (7.9.8.1.225)	Radiated power measured by the various lines of sights [W]. Vector (nchords). Time-dependent.

Type of: bolometer:measure (4130)

7.9.8.1.91 bolometer_processed

Processed values

member	type	description
prad_tot	exp0D (7.9.8.1.224)	Total radiated power [W]. Time-dependent.
prad_core	exp0D (7.9.8.1.224)	Radiated power from the core plasma [W]. Time-dependent.

Type of: bolometer:process (4130)

7.9.8.1.92 bolometer_setup

diagnostic setup information

member	type	description
id	vecstring_type (7.9.8.1.20)	ID of the lines of sight. Array of strings (nchords).
los	setup_line (7.9.8.1.424)	Geometry of the lines of sight.
etendue	vecflt_type (7.9.8.1.18)	Etendue of the detector geometry [m^2.sr]. Array of floats (nchords).

Type of: bolometer:setup (4130)

7.9.8.1.93 boundary

Boundary condition for the transport equation. Time-dependent.

member	type	description
value	vecflt_type (7.9.8.1.18)	Value of the boundary condition (in case flag = 2). Unit depends on type, respectively [1-Wb, 2-A, 3-V]. For type 1 to 3, only the first position in the vector is used. For type 5, all three positions are used, meaning respectively a1, a2, a3. Time-dependent. Vector(3).
source	string (7.9.8.1.4)	Source of the boundary condition (any comment describing its origin : code, path to diagnostic signals, massaging); String
type	integer (7.9.8.1.3)	Type of the boundary condition for the transport solver (in case flag = 2). 0- equation not solved; 1- edge value of poloidal flux; 2- total current inside boundary; 3- edge Vloop; 4- not defined; 5- generic boundary condition expressed as a1*(dpsi_drho_tor)+a2*psi=a3. . Time-dependent.Scalar
rho	float (7.9.8.1.2)	Position of the boundary condition (in terms of toroidal flux coordinate) for the transport solver [m]. Outside this boundary, the value of the data are considered to be prescribed. Scalar
codeparam	codeparam (7.9.8.1.105)	Code parameters

Type of: psi:boundary (4472)

7.9.8.1.94 boundary_neutrals

Structure for the boundary condition of core transport equations (neutrals). Time-dependent;

member	type	description
value	vecflt_type (7.9.8.1.18)	Value of the boundary condition. Unit depends on type, respectively [1-field, 2-field.m^-1, 3-m, 4-field.s^-1]. For type 1 to 4, only the first position in the vector is used. For type 5, all three positions are used, meaning respectively a1, a2, a3. Time-dependent. Array1D(3)
type	integer (7.9.8.1.3)	Type of the boundary condition for the transport solver. 0- equation not solved; 1- value of the field y; 2-radial derivative of the field (-dy/drho_tor); 3-scale length of the field y/(-dy/drho_tor); 4- flux; 5- generic boundary condition y expressed as a1y'+a2y=a3. Time-dependent. Int
rho_tor	float (7.9.8.1.2)	Position of the boundary condition (in terms of toroidal flux coordinate) for the transport solver [m]. Outside this boundary, the value of the data are considered to be prescribed. Time-dependent. Float.

Type of: corefieldneutral:boundary (4240) I corefieldneutrale:boundary (4241) I corefieldneutralv:boundary (4242)

7.9.8.1.95 boundaryel

Structure for the boundary condition of core transport equations (electrons) Time-dependent;

member	type	description
value	vecflt_type (7.9.8.1.18)	Value of the boundary condition (in case flag = 2). Unit depends on type, respectively [1-field, 2-field.m^-1, 3-m, 4-field.s^-1]. For type 1 to 4, only the first position in the vector is used. For type 5, all three positions are used, meaning respectively a1, a2, a3. Time-dependent. Vector(3).
source	string (7.9.8.1.4)	Source of the boundary condition (any comment describing its origin : code, path to diagnostic signals, massaging); String
type	integer (7.9.8.1.3)	Type of the boundary condition for the transport solver (in case flag = 2). 0- equation not solved; 1- value of the field y; 2-radial derivative of the field (-dy/drho_tor); 3-scale length of the field y/(-dy/drho_tor); 4- flux; 5- generic boundary condition y expressed as a1y'+a2y=a3. Time-dependent. Scalar
rho_tor	float (7.9.8.1.2)	Position of the boundary condition (in terms of toroidal flux coordinate) for the transport solver [m]. Outside this boundary, the value of the data are considered to be prescribed. Time-dependent. Scalar

Type of: corefield:boundary (4238)

7.9.8.1.96 boundaryimp

Structure for the boundary condition of core transport equations (impurities) Time-dependent

member	type	description
value	matflt_type (7.9.8.1.15)	Value of the boundary condition (in case flag = 2). Unit depends on type, respectively [1-field, 2-field.m^-1, 3-m, 4-field.s^-1]. For type 1 to 4, only the first position in the first dimension is used. For type 5, all three positions are used, meaning respectively a1, a2, a3. Time-dependent. Array 2D (3,nzimp)
source	string (7.9.8.1.4)	Source of the boundary condition (any comment describing its origin : code, path to diagnostic signals, massaging); String
type	vecint_type (7.9.8.1.19)	Type of the boundary condition for the transport solver (in case flag = 2). 0- equation not solved; 1- value of the field y; 2-radial derivative of the field (-dy/drho_tor); 3-scale length of the field y/(-dy/drho_tor); 4- flux; 5- generic boundary condition y expressed as a1y'+a2y=a3. Time-dependent. Vector(nzimp)
rho	vecflt_type (7.9.8.1.18)	Position of the boundary condition (in terms of toroidal flux coordinate) for the transport solver [m]. Outside this boundary, the value of the data are considered to be prescribed. Time-dependent. Vector(nzimp)
codeparam	codeparam (7.9.8.1.105)	Code parameters

Type of: impurity_type:boundary (4369)

7.9.8.1.97 boundaryion

Structure for the boundary condition of core transport equations (ions) Time-dependent

member	type	description
value	matflt_type (7.9.8.1.15)	Value of the boundary condition (in case flag = 2). Unit depends on type, respectively [1-field, 2-field.m^-1, 3-m, 4-field.s^-1]. For type 1 to 4, only the first position in the first dimension is used. For type 5, all three positions are used, meaning respectively a1, a2, a3. Time-dependent. Matrix(3,nion)
source	vecstring_type (7.9.8.1.20)	Source of the boundary condition (any comment describing its origin : code, path to diagnostic signals, massaging); Array of strings (nion)

member	type	description
type	vecint_type (7.9.8.1.19)	Type of the boundary condition for the transport solver (in case flag = 2). 0- equation not solved; 1- value of the field y; 2-radial derivative of the field (-dy/drho_tor); 3-scale length of the field y/(-dy/drho_tor); 4- flux; 5- generic boundary condition y expressed as a1y'+a2y=a3. Time-dependent. Vector(nion)
rho_tor	vecflt_type (7.9.8.1.18)	Position of the boundary condition (in terms of toroidal flux coordinate) for the transport solver [m]. Outside this boundary, the value of the data are considered to be prescribed. Time-dependent. Vector(nion)

Type of: corefieldion:boundary (4239)

7.9.8.1.98 bpol_probes

Poloidal field probes

member	type	description
setup_bprobe	setup_bprobe (7.9.8.1.422)	diagnostic setup information
measure	exp1D (7.9.8.1.225)	Measured value [T]; Time-dependent; Vector (nprobes)

Type of: magdiag:bpol_probes (4155)

7.9.8.1.99 bremsstrahl_measure

Measured values

member	type	description
zeff	exp1D (7.9.8.1.225)	Effective charge measured along a line of sight [-]. Time-dependent. Vector (nchords)

Type of: bremsstrahl:measure (4131)

7.9.8.1.100 bremsstrahl_setup

diagnostic setup information

member	type	description
id	vecstring_type (7.9.8.1.20)	ID of the lines of sight. Array of strings (nchords).
los	setup_line_exp (7.9.8.1.425)	Geometry of the lines of sight.

Type of: bremsstrahl:setup (4131)

7.9.8.1.101 calorimetry_heat_source

Generic complex type for heat source or sink

member	type	description
name	string (7.9.8.1.4)	Name of the source. String
temp_in	float (7.9.8.1.2)	Temperature of the input flow [K]; Scalar
temp_out	float (7.9.8.1.2)	Temperature of the output flow [K]; Scalar
press_in	float (7.9.8.1.2)	Imput Pressure [Pa];Scalar
press_out	float (7.9.8.1.2)	Output Pressure [Pa];Scalar
flow	float (7.9.8.1.2)	Flow of the source [kg/s]; Scalar
power	float (7.9.8.1.2)	Power of the source [W];Scalar

Type of: heat_sources:sinks (4149) I heat_sources:sources (4149)

7.9.8.1.102 circuits

Description of the circuit of the power conversion system. Array of structure. (ncircuits).

member	type	description
component(:)	power_conv_component (7.9.8.1.364)	Description of the components of the power conversion system. Array of structure (ncomp).

member	type	description
power_net	float (7.9.8.1.2)	Net electric power generated [W]. Scalar
power_int	float (7.9.8.1.2)	Total electric power consumption of the power conversion system.[W]. Scalar
efficiency	float (7.9.8.1.2)	Efficiency of the reactor (ratio of the alternator electrical power to the total power needed to operate the reactor)

Type of: power_conv:circuits (4165)

7.9.8.1.103 circularcoil

Circular coil description

member	type	description
centre	rz0D (7.9.8.1.386)	Circular coil centre
hlength	float (7.9.8.1.2)	Half length along coil axis [m]
radialhwidth	float (7.9.8.1.2)	Half width, (outer radius-inner radius)/2 [m]

Type of: tf_desc_tfcoils:circularcoil (4585)

7.9.8.1.104 clusters

Cluster of tile rings to define and reference superset structures using the individual tile rings. A coil ring can coexist on two top level structures. Structure array (ncluster).

member	type	description
name	string (7.9.8.1.4)	Name of the toroidally distributed tile set. String.
start	integer (7.9.8.1.3)	ID of the tile set as a scalar where this superset starts. Integer.
finish	integer (7.9.8.1.3)	ID of the tile set as a scalar where this superset finishes. Integer.

Type of: solcurdiag:clusters (4170)

7.9.8.1.105 codeparam

Code parameters

member	type	description
codename	string (7.9.8.1.4)	Name of the code
codeversion	string (7.9.8.1.4)	Version of the code (as in the ITM repository)
parameters	string (7.9.8.1.4)	List of the code specific parameters, string expected to be in XML format.
output_diag	string (7.9.8.1.4)	List of the code specific diagnostic/output, string expected to be in XML format.
output_flag	integer (7.9.8.1.3)	Output flag : 0 means the run is successful, other values meaning some difficulty has been encountered, the exact meaning is then code specific. Negative values mean the result shall not be used. Exact rules could discussed and implemented in the module wrapper. Time-dependent.

Type of: amns:codeparam (4127) I antenna_ec:codeparam (4180) I antenna_ic:codeparam (4181) I antenna_lh:codeparam (4182) I antennas:codeparam (4128) I bb_shield:codeparam (4129) I bolometer:codeparam (4130) I boundary:codeparam (4196) I boundaryimp:codeparam (4199) I bremsstrahl:codeparam (4131) I coherentwave:codeparam (4210) I compositionc:codeparam (4132) I coredelta:codeparam (4133) I coredelta_values:codeparam (4235) I corefast:codeparam (4134) I corefast_values:codeparam (4237) I corefield:codeparam (4238) I corefieldion:codeparam (4239) I coreimpur:codeparam (4135) I coreneutrals:codeparam (4136) I coreprof:codeparam (4137) I coresource:codeparam (4138) I coresource_values:codeparam (4256) I coretransp:codeparam (4139) I coretransp_values:codepara (4260) I cxdiag:codeparam (4140) I distri_vec:codeparam (4297) I distribution:codeparam (4141) I distsource:codeparam (4142) I distsource_source:codeparam (4302) I ecediag:codeparam (4143) I edge:codeparam (4144) I efcc:codeparam (4145) I equilibrium:codeparam (4146) I flush:codeparam (4334) I fusiondiag:codeparam (4147) I fusiondiag_fus_product:cod (4353) I halphadiag:codeparam (4148) I heat_sources:codeparam (4149) I ironmodel:codeparam (4151) I langmuirdiag:codeparam (4152) I launchs:codeparam (4153) I lineintegraldiag:codeparam (4385) I lithiumdiag:codeparam (4154) I magdiag:codeparam (4155) I mhd:codeparam (4156) I msediag:codeparam (4157) I nbi:codeparam (4158) I nbi_unit:codeparam (4417) I neoclassic:codeparam (4159) I ntm:codeparam (4160) I orbit:codeparam (4161) I pellets:codeparam (4162) I pfsystems:codeparam (4163) I power_conv:codeparam (4165) I psi:codeparam (4472) I reflectomet:codeparam (4166) I rfadiag:codeparam (4167) I sawteeth:codeparam (4168) I scenario:codeparam (4169) I solcurdiag:codeparam (4170) I spectral:codeparam (4543) I temporary:codeparam (4171) I toroidfield:codeparam

(4173) I tsdiag:codeparam (4174) I turbulence:codeparam (4175) I wall:codeparam (4176) I waves:codeparam (4177)

7.9.8.1.106 coefficients_neutrals

Recycling and sputtering coefficients used by the neutral solver. The particular causing ion or impurity charge state is determined by the path.

member	type	description
recycling	recycling_neutrals (7.9.8.1.375)	Recycling coefficients. Time-dependent
sputtering	sputtering_neutrals (7.9.8.1.443)	Sputtering coefficients. Time-dependent

Type of: coreneutrals:ioncoeff (4136) I impcoeff:chargestate (4367)

7.9.8.1.107 coherentwave

Wave description for each frequency. Time-dependent. Structure array(nfreq)

member	type	description
wave_id	enum_instance (7.9.8.1.216)	List of identifiers for the coherent-wave, in terms of the type and name of the antenna driving the wave and an index separating waves driven by the same antenna. Possible types: EC/LH/IC (see waves_types in the Documentation website under Conventions/Enumerated_datatypes); the field name should include the name of the antenna as specified in either antennas(*)%ec_antenna%name, antennas(*)%ic_antenna%name, or antennas(*)%lh_antenna%name; the field index should separate different waves generated from a single antenna.
composition	composition (7.9.8.1.123)	Plasma composition (description of ion species). OBSOLESCENT.
compositions	compositions_type (7.9.8.1.127)	Contains detailed information on the plasma composition (main ions, impurities, neutrals, edge species).
global_param	waves_global_param (7.9.8.1.526)	Global wave deposition parameters
grid_1d	waves_grid_1d (7.9.8.1.527)	Grid points for 1D profiles.
grid_2d	waves_grid_2d (7.9.8.1.528)	Grid points for 2D profiles and for full wave solutions.
profiles_1d	waves_profiles_1d (7.9.8.1.529)	1D radial profiles
profiles_2d	waves_profiles_2d (7.9.8.1.530)	2D profiles in poloidal cross-section
beamtracing(:)	beamtracing (7.9.8.1.89)	Beam-tracing or ray-tracing solver. Vector(nbeams). Time-dependent
fullwave	fullwave (7.9.8.1.237)	Solution by full wave code
codeparam	codeparam (7.9.8.1.105)	Code parameters

Type of: waves:coherentwave (4177)

7.9.8.1.108 coil

Individual coil. Time-dependent. Structure array. Replicate this coil structure for coil element in the efcc array.

member	type	description
desc_coils	desc_coils (7.9.8.1.163)	Description of the coils
coilcurrent	exp1D (7.9.8.1.225)	Circuit feed current in the coil, defined positive if it flows from point 1 to point 2 of the geometry description [A]; Time-dependent
coilvoltage	exp1D (7.9.8.1.225)	Voltage on the full coil [V]; Time-dependent

Type of: efcc:coil (4145)

7.9.8.1.109 com

COM (Constants Of Motion) parameters identifying an orbit

member	type	description
amn	float (7.9.8.1.2)	Atomic mass of the particle; Scalar
zion	float (7.9.8.1.2)	Atomic charge of the particle; Scalar
energy	vecflt_type (7.9.8.1.18)	Energy of the particle [keV]; Time-dependent; Vector (norbits).
magn_mom	vecflt_type (7.9.8.1.18)	Magnetic momentum [kg m^2 / s^2 / T]; Time-dependent, Vector(norbits).

member	type	description
p_phi	vecflt_type (7.9.8.1.18)	toroidal angular momentum [kg m^2 / s]; Time-dependent; Vector(norbits);
sigma	vecint_type (7.9.8.1.19)	Sign of parallel velocity at psi=psi_max along the orbit; Time-dependent; Vector(norbits)

Type of: orbit:com (4161)

7.9.8.1.110 complexgrid

Generic definition of a complex grid

member	type	description
uid	integer (7.9.8.1.3)	Unique index of this grid. Used for handling multiple grids
id	string (7.9.8.1.4)	Name / identifier string for this grid
spaces(:)	complexgrid_space (7.9.8.1.119)	Definitions of grid spaces. Array of structures (number of spaces)
subgrids(:)	complexgrid_subgrid (7.9.8.1.120)	Definitions of subgrids. Array of structures (number of subgrids)
metric	complexgrid_metric (7.9.8.1.113)	Metric coefficients
geo(:)	complexgrid_geo_global (7.9.8.1.111)	Geometry data for implicit objects
bases(:)	complexgrid_vector (7.9.8.1.121)	Vector bases. Used for aligned vector representation. Time-dependent (added systematically for the COMP child inheritance of that property). Array of structures (number of bases)

Type of: edge:grid (4144) I f_expansion:grid (4330) I fullwave:grid (4340) I source_rate:grid (4536) I wall3d:grid (4614)

7.9.8.1.111 complexgrid_geo_global

Geometry information for implicitly defined grid objects (which cannot be stored in the space definitions); Array of structures (number of alternate geometries).

member	type	description
geotype	integer (7.9.8.1.3)	Type of geometry (id flag). A flag defining how the geometry data associated with grid objects is to be interpreted. If the field is undefined (0=GRID_UNDEFINED), the standard interpretation for; the given coordinate types is assumed.
geotypeid	string (7.9.8.1.4)	Type of geometry (id string).
coordtype	vecint_type (7.9.8.1.19)	Type of coordinates describing the physical space. Vector (number of space dimensions); The size of coordtype defines the dimension of the space.; For predefined integer constants for standard coordinates see; the documentation of the grid service library.
geo_matrix(:)	complexgrid_scalar (7.9.8.1.115)	Geometry data matrix associated with implicit objects. Array of structures (number of subgrids this information is stored on); The exact definition of the stored values depends on the geometry type of the geometry complexgrid_geo_global.geotype;
measure(:)	complexgrid_scalar (7.9.8.1.115)	Measure of object, i.e. physical size (length for 1d, area for 2d, volume for 3d objects) in this geometry. [m^dim].; Use this field to store measures of implicitly defined grid objects.; Array of structures (number of subgrids this information is stored on)

Type of: complexgrid:geo (4213)

7.9.8.1.112 complexgrid_indexlist

An index list describing a list of indices or a range of indices.; If the explicit index list ind is defined and has nonzero size, the list is assumed to be an explicit index list.; Otherwise it is assumed to be a range of indices.; A single index can either be defined by using an explicit list with a single entry or as a range with identical; start and end index.

member	type	description
range	vecint_type (7.9.8.1.19)	Defines an index range enumerating from range[1] to range[2] (with both range[1] and range[2] included). If additionally a third value range(3) is given, it is used as a stride. If it is omitted, a stride of 1 is assumed. Vector(3)
ind	vecint_type (7.9.8.1.19)	An explicit list of indices. If this member is defined and has nonzero size, the list is assumed to be explicit. Vector(length of explicit index list)

Type of: complexgrid_objectlist:indset (4217)

7.9.8.1.113 complexgrid_metric

Metric information for grid objects

member	type	description
measure(:)	complexgrid_scalar (7.9.8.1.115)	Measure of object, i.e. physical size (length for 1d, area for 2d, volume for 3d objects). [m^dim].; Use this field to store measures of implicitly defined grid objects.; Array of structures (number of subgrids this information is stored on)
g11(:)	complexgrid_scalar (7.9.8.1.115)	Metric coefficients g11. Array of structures (number of subgrids this information is stored on)
g12(:)	complexgrid_scalar (7.9.8.1.115)	Metric coefficients g12. Array of structures (number of subgrids this information is stored on)
g13(:)	complexgrid_scalar (7.9.8.1.115)	Metric coefficients g13. Array of structures (number of subgrids this information is stored on)
g22(:)	complexgrid_scalar (7.9.8.1.115)	Metric coefficients g22. Array of structures (number of subgrids this information is stored on)
g23(:)	complexgrid_scalar (7.9.8.1.115)	Metric coefficients g23. Array of structures (number of subgrids this information is stored on)
g33(:)	complexgrid_scalar (7.9.8.1.115)	Metric coefficients g33. Array of structures (number of subgrids this information is stored on)
jacobian(:)	complexgrid_scalar (7.9.8.1.115)	Jacobian. Array of structures (number of subgrids this information is stored on)

Type of: complexgrid:metric (4213)

7.9.8.1.114 complexgrid_objectlist

A list of grid objects with a common class, either in explicit of implicit form.; The list is explicit if the matrix ind is given and has nonzero size. In this case the index tuples are listed in ind.; Otherwise the list is implicit and the index tuples are defined by a list of index lists stored in indset.

member	type	description
cls	vecint_type (7.9.8.1.19)	Class tuple of the grid objects in this object list. Vector (number of grid spaces)
indset(:)	complexgrid_indexlist (7.9.8.1.112)	Implicit list of the object indices.; Array of structures (number of grid spaces = length of index tuple). Every index of the index tuple is described by an index set, which defines either a list of index values or a range of index values.
ind	matint_type (7.9.8.1.16)	Explicit list of index tuples. Matrix (number of objects, number of spaces in grid).; First dimension: object index, second dimension: index tuple/space index.; If this field is defined and has nonzero size, the object list is understood to be explicit.

Type of: complexgrid_subgrid:list (4223)

7.9.8.1.115 complexgrid_scalar

A quantity stored on a grid. The data is given either as a vector of scalars, vectors or matrices.; Note that the vector and matrix storage methods are not meant for multidimensional data, but; for complex data representations with multiple degrees of freedom.; To be used as arrays of structure; FIXME: add non-timedependent element "label" of type string

member	type	description
griduid	integer (7.9.8.1.3)	Unique identifier of the grid this scalar quantity is associated with.
subgrid	integer (7.9.8.1.3)	Index of the subgrid (as stored in grid.subgrids) the data is stored on.
scalar	vecflt_type (7.9.8.1.18)	Scalar representation of data. One scalar entry is stored per object in the subgrid.; The order is implicitly defined by the subgrid.; Float Vector(nobjects_subgrid). First dimension: object index.
vector	matflt_type (7.9.8.1.15)	Vector representation of data. One vector is stored per object in the subgrid. The order is implicitly defined by the subgrid.; Float matrix(nobjects_subgrid, ndata).First dimension: object index, second dimension: index of data vector.
matrix	array3dflt_type (7.9.8.1.7)	Matrix representation of data. One matrix is stored per object in the subgrid. The order is implicitly defined by the subgrid.; 3d float array(nobjects_subgrid,ndata1,ndata2). First dimension: object index, second dimension: matrix row, third dimension: matrix column.

Type of: complexgrid_geo_global:geo_matrix (4214) I complexgrid_geo_global:measure (4214) I complexgrid_metric:g11 (4216) I complexgrid_metric:g12 (4216) I complexgrid_metric:g13 (4216) I complexgrid_metric:g22 (4216) I complexgrid_metric:g23 (4216) I complexgrid_metric:g33 (4216) I complexgrid_metric:jacobian (4216) I complexgrid_metric:measure (4216) I complexgrid_vector:comp (4224) I complexgrid_vector_simplestruct:comp (4225) I edge_fluid_scalar:bndvalue (4308) I edge_fluid_scalar:source (4308) I edge_fluid_scalar:value (4308) I edge_fluid_scalar_simple (4309) I edge_fluid_scalar_simplestruct:source (4309) I edge_fluid_scalar_simplestruct:value (4309) I edge_kinetic_distribution

(4314) I edge_kinetic_distribution:source (4314) I edge_kinetic_distribution:value (4314) I f_expansion:values (4330) I source_rate:value (4536) I wall_unitsComplexType:eta (4620) I wall_unitsComplexType:permeability (4620)

7.9.8.1.116 complexgrid_scalar_cplx

A quantity stored on a grid. The data is given either as a vector of scalars, vectors or matrices.; Note that the vector and matrix storage methods are not meant for multidimensional data, but; for complex data representations with multiple degrees of freedom.; To be used as arrays of structure; FIXME: add non-timedependent element "label" of type string

member	type	description
griduid	integer (7.9.8.1.3)	Unique identifier of the grid this scalar quantity is associated with.
subgrid	integer (7.9.8.1.3)	Index of the subgrid (as stored in grid.subgrids) the data is stored on.
scalar	veccplx_type (7.9.8.1.17)	Scalar representation of data. One scalar entry is stored per object in the subgrid.; The order is implicitly defined by the subgrid.; Complex Vector(nobjects_subgrid). First dimension: object index.
vector	matcplx_type (7.9.8.1.14)	Vector representation of data. One vector is stored per object in the subgrid. The order is implicitly defined by the subgrid.; Complex matrix(nobjects_subgrid, ndata).First dimension: object index, second dimension: index of data vector.
matrix	array3dcplx_type (7.9.8.1.6)	Matrix representation of data. One matrix is stored per object in the subgrid. The order is implicitly defined by the subgrid.; 3d complex array(nobjects_subgrid,ndata1,ndata2). First dimension: object index, second dimension: matrix row, third dimension: matrix column.

Type of: e_components:b_binorm (4304) I e_components:b_norm (4304) I e_components:b_para (4304) I e_components:e_binorm (4304) I e_components:e_minus (4304) I e_components:e_norm (4304) I e_components:e_para (4304) I e_components:e_plus (4304) I e_components:k_perp (4304)

7.9.8.1.117 complexgrid_scalar_int

A quantity stored on a grid. The data is given either as a vector of scalars, vectors or matrices.; Note that the vector and matrix storage methods are not meant for multidimensional data, but; for complex data representations with multiple degrees of freedom.; To be used as arrays of structure; FIXME: add non-timedependent element "label" of type string

member	type	description
griduid	integer (7.9.8.1.3)	Unique identifier of the grid this scalar quantity is associated with.
subgrid	integer (7.9.8.1.3)	Index of the subgrid (as stored in grid.subgrids) the data is stored on.
scalar	vecint_type (7.9.8.1.19)	Scalar representation of data. One scalar entry is stored per object in the subgrid.; The order is implicitly defined by the subgrid.; Float Vector(nobjects_subgrid). First dimension: object index.
vector	matint_type (7.9.8.1.16)	Vector representation of data. One vector is stored per object in the subgrid. The order is implicitly defined by the subgrid.; Float matrix(nobjects_subgrid, ndata).First dimension: object index, second dimension: index of data vector.
matrix	array3dint_type (7.9.8.1.8)	Matrix representation of data. One matrix is stored per object in the subgrid. The order is implicitly defined by the subgrid.; 3d float array(nobjects_subgrid,ndata1,ndata2). First dimension: object index, second dimension: matrix row, third dimension: matrix column.

7.9.8.1.118 complexgrid_scalar_simplestruct

A quantity stored on a grid. The data is given either as a vector of scalars, vectors or matrices.; Note that the vector and matrix storage methods are not meant for multidimensional data, but; for complex data representations with multiple degrees of freedom.; To be used as a simple structure; FIXME: add non-timedependent element "label" of type string

member	type	description
subgrid	integer (7.9.8.1.3)	Index of the subgrid (as stored in grid.subgrids) the data is stored on.
scalar	vecflt_type (7.9.8.1.18)	Scalar representation of data. One scalar entry is stored per object in the subgrid.; The order is implicitly defined by the subgrid.; Float Vector(nobjects_subgrid). First dimension: object index.
vector	matflt_type (7.9.8.1.15)	Vector representation of data. One vector is stored per object in the subgrid. The order is implicitly defined by the subgrid.; Float matrix(nobjects_subgrid, ndata).First dimension: object index, second dimension: index of data vector.
matrix	array3dflt_type (7.9.8.1.7)	Matrix representation of data. One matrix is stored per object in the subgrid. The order is implicitly defined by the subgrid.; 3d float array(nobjects_subgrid,ndata1,ndata2). First dimension: object index, second dimension: matrix row, third dimension: matrix column.

7.9.8.1.119 complexgrid_space

Description of a grid space

member	type	description
geotype	vecint_type (7.9.8.1.19)	Type of space geometry (id flags). Flags defining how the geometry (objects.geo) fields associated with; space objects are to be interpreted. Array (number of geometries defined for this space),; first dimension: geometry index. A flag value of GRID_UNDEFINED=0 indicates the standard interpretation for; the given coordinates.
geotypeid	vecstring_type (7.9.8.1.20)	Type of space geometries (id string). See geotype.
coordtype	matint_type (7.9.8.1.16)	Type of coordinates describing the physical space. Vector (number of space dimensions); The size of coordtype defines the dimension of the space.; For predefined integer constants for standard coordinates see; the documentation of the grid service library.
objects(:)	objects (7.9.8.1.328)	Definition of the space objects.; Array of structures (dimension of highest-dimensional objects).; First dimension: dimension of the objects (1=nodes, 2=edges, 3=faces, 4=cells/volumes, ...)
xpoints	vecint_type (7.9.8.1.19)	List of indices of all nodes which are x-points. Vector (number of x-points)

Type of: complexgrid:spaces (4213)

7.9.8.1.120 complexgrid_subgrid

Subgrid definition. A subgrid is a list of grid objects, given as a list of explict or implicit object lists.

member	type	description
id	string (7.9.8.1.4)	ID string (name) of the subgrid.
list(:)	complexgrid_objectlist (7.9.8.1.114)	List of object lists. Array of structures (number of object lists).

Type of: complexgrid:subgrids (4213)

7.9.8.1.121 complexgrid_vector

A vector quantity stored on a grid, with components possibly explicitly aligned to a coordinate direction. To be used as array of structure.

member	type	description
griduid	integer (7.9.8.1.3)	Unique identifier of the grid this vector quantity is associated with.
label	string (7.9.8.1.4)	Label describing the data
comp(:)	complexgrid_scalar (7.9.8.1.115)	Components of the vector. Array of structures (number of vector components). Time-dependent; FIXME: inherit time-dependence for this element
align	vecint_type (7.9.8.1.19)	Alignment flag for vector components. Integer vector (number of vector components).
alignid	vecstring_type (7.9.8.1.20)	Alignment id for vector components. String vector (number of vector components).
basis	integer (7.9.8.1.3)	Index of basis (defined in associated grid) this vector is aligned to; If set to GRID_UNDEFINED=0, the canonical basis of the default coordinates of the grid assumed.

Type of: complexgrid:bases (4213) I edge_fluid:b (4307) I edge_fluid_scalar:bndflux (4308) I edge_fluid_scalar:flux (4308) I edge_fluid_scalar_simplestruct:bndflux (4309) I edge_fluid_scalar_simplestruct:flux (4309) I edge_kinetic_distribution (4314) I wall_unitsComplexType:j (4620)

7.9.8.1.122 complexgrid_vector_simplestruct

A vector quantity stored on a grid, with components possibly explicitly aligned to a coordinate direction. To be used as simple structure

member	type	description
label	string (7.9.8.1.4)	Label describing the data
comp(:)	complexgrid_scalar (7.9.8.1.115)	Components of the vector. Vector of griddata(ndim). Time-dependent; FIXME: inherit time-dependence for this element
align	vecint_type (7.9.8.1.19)	Alignment of vector components, numerical flag. Int vector(ndim)
alignid	vecstring_type (7.9.8.1.20)	Alignment of vector components, string description. String vector(ndim)

Type of: edge_fluid_scalar_transpcoeff:d (4310) I edge_fluid_scalar_transpcoeff:v (4310)

7.9.8.1.123 composition

Plasma composition (description of ion species). OBSOLESCENT.

member	type	description
amn	vecflt_type (7.9.8.1.18)	Atomic mass number (lumped ions are allowed); Vector (nion)
zn	vecflt_type (7.9.8.1.18)	Nuclear charge (lumped ions are allowed); Vector (nion)
zion	vecflt_type (7.9.8.1.18)	Ion charge (of the dominant ionisation state; lumped ions are allowed); Vector (nion)
imp_flag	vecint_type (7.9.8.1.19)	Multiple charge state calculation flag : 0-Only one charge state is considered; 1-Multiple charge state are considered and are described in impurity CPO; Vector (nion)
label	vecstring_type (7.9.8.1.20)	Label for the ions - note the charge state is not included; String Vector (nion)

Type of: coherentwave:composition (4210) I coredelta:composition (4133) I corefast:composition (4134) I coreneutrals:composition (4136) I coreprof:composition (4137) I coresource:composition (4138) I coretransp:composition (4139) I distribution:composition (4141) I distsource:composition (4142) I neoclassic:composition (4159) I sawteeth:composition (4168)

7.9.8.1.124 composition_neutrals

Description of neutrals species

member	type	description
atomlist(:)	coreneutrals_atomlist (7.9.8.1.149)	List of the atoms that enter the composition of the neutral species. Vector(natm)
neutral(:)	composition_neutralscomp (7.9.8.1.126)	List of neutrals. Vector(nneut)

Type of: coreneutrals:neutcompo (4136)

7.9.8.1.125 composition_neutrals_neutcomp

Array of components to the atom or molecule. Vector (ncomp)

member	type	description
nucindex	integer (7.9.8.1.3)	Index into list of nuclei; int
multiplicity	integer (7.9.8.1.3)	Multiplicity of the atom; int

Type of: composition_neutralscomp:neutcomp (4229)

7.9.8.1.126 composition_neutralscomp

Array of neutrals.

member	type	description
neutcomp(:)	composition_neutrals_neutcomp (7.9.8.1.125)	Array of components to the atom or molecule. Vector (ncomp)
type(:)	identifier (7.9.8.1.263)	Type of neutral, in terms of energy : 0=cold, 1=thermal, 2= fast, 3=NBI. Vector (ntype) of identifiers
label	string (7.9.8.1.4)	String identifying the atom or molecule (e.g. D2, DT, CD4, ...)

Type of: composition_neutrals:neutral (4227) I compositions_type:neutralscomp (4230)

7.9.8.1.127 compositions_type

Generic declaration of Plasma composition for a simulation

member	type	description
nuclei(:)	nuclei (7.9.8.1.327)	Array of nuclei considered.
ions(:)	ions (7.9.8.1.268)	Array of main plasma ions.
impurities(:)	impurities (7.9.8.1.265)	Array of impurities.
neutralscomp(:)	composition_neutralscomp (7.9.8.1.126)	Array of neutrals.
edgespecies(:)	edgespecies (7.9.8.1.213)	Array of edge species.

member	type	description
signature	identifier (7.9.8.1.263)	Identifier for species choices. The goal of this is to uniquely capture the species blocks so that if the signatures are the same then the species blocks will also be the same.

Type of: coherentwave:compositions (4210) I compositionc:compositions (4132) I coredelta:compositions (4133) I corefast:compositions (4134) I coreimpur:compositions (4135) I coreneutrals:compositions (4136) I coreprof:compositions (4137) I coresource:compositions (4138) I coretransp:compositions (4139) I distribution:compositions (4141) I distsource:compositions (4142) I edge:compositions (4144) I neoclassic:compositions (4159) I pellets:compositions (4162) I wall:compositions (4176)

7.9.8.1.128 compound_desc

Chemical compounds (e.g. solid tungsten, WC, CFC, ...) possibly present in the wall. Array of structure (number of compounds)

member	type	description
label	string (7.9.8.1.4)	Compound name/label
stochiometry	vecflt_type (7.9.8.1.18)	Fractional composition of the compound. Float vector, dimensions: 1. element number (numbering as in wall/elements array)
density	float (7.9.8.1.2)	Compound density (molecules/m^3)
heat_cap	float (7.9.8.1.2)	Specific heat capacity [J/(eV kg)]
heat_cond	vecflt_type (7.9.8.1.18)	Thermal conductivity [W/(m eV)]
surf_recrate	matflt_type (7.9.8.1.15)	Recombination rate on surface (only for pure elements, not compounds) [molecules*m^2/s]; Dimensions: index 1: first recombining element, index 2: second recombining element (numbering as in wall/elements array)

Type of: wall:compounds (4176)

7.9.8.1.129 coord_sys

flux surface coordinate system on a square grid of flux and angle

member	type	description
grid_type	string (7.9.8.1.4)	Type of coordinate system
grid	reggrid (7.9.8.1.382)	Regular grid definition; Time-dependent
jacobian	matflt_type (7.9.8.1.15)	Jacobian of the coordinate system; Time-dependent; Matrix (ndim1, ndim2)
g_11	matflt_type (7.9.8.1.15)	metric coefficients g_11; g_ij=g^ij are contravariant metric tensor for the grid described by grid_type. Time-dependent; Matrix (ndim1, ndim2)
g_12	matflt_type (7.9.8.1.15)	metric coefficients g_12; g_ij=g^ij are contravariant metric tensor for the grid described by grid_type. Time-dependent; Matrix (ndim1, ndim2)
g_13	matflt_type (7.9.8.1.15)	metric coefficients g_13; g_ij=g^ij are contravariant metric tensor for the grid described by grid_type. Time-dependent; Matrix (ndim1, ndim2)
g_22	matflt_type (7.9.8.1.15)	metric coefficients g_22; g_ij=g^ij are contravariant metric tensor for the grid described by grid_type. Time-dependent; Matrix (ndim1, ndim2)
g_23	matflt_type (7.9.8.1.15)	metric coefficients g_23; g_ij=g^ij are contravariant metric tensor for the grid described by grid_type. Time-dependent; Matrix (ndim1, ndim2)
g_33	matflt_type (7.9.8.1.15)	metric coefficients g_33; g_ij=g^ij are contravariant metric tensor for the grid described by grid_type. Time-dependent; Matrix (ndim1, ndim2)
position	rz2D (7.9.8.1.390)	R and Z position of grid points; Time-dependent; Matrix (ndim1, ndim2)

Type of: equilibrium:coord_sys (4146) I mhd_plasma:coord_sys (4396) I mhd_vacuum:coord_sys (4398)

7.9.8.1.130 coordinates

Poloidal and Toroidal coordinates of the center of each hole;

member	type	description
theta	vecflt_type (7.9.8.1.18)	Theta coordinate of holes center; Vector (n_holes)
phi	vecflt_type (7.9.8.1.18)	Toroidal coordinate of holes center; Vector (n_holes)

Type of: holes:coordinates (4365)

7.9.8.1.131 coords

Specification of coordinates in one dimension. Can be either a range of real values or a set of discrete values (if interp_type=0).

member	type	description
coord	vecflt_type (7.9.8.1.18)	Coordinate values. Vector(npoints).
coord_label	vecstring_type (7.9.8.1.20)	String description of discrete coordinate values (if interp_type=0). Vector(npoints). E.g., for spectroscopic lines, the spectroscopic description of the transition.
extrap_type	vecint_type (7.9.8.1.19)	Extrapolation strategy when leaving the domain. Vector(2). Entry 1: behaviour at lower bound, entry 2: behaviour at upper bound.; Possible values: 0=none, report error; 1=boundary value; 2=linear extrapolation;
interp_type	integer (7.9.8.1.3)	Interpolation strategy in this coordinate direction. Integer flag: 0=discrete (no interpolation); 1=linear; ...
label	string (7.9.8.1.4)	Description of coordinate (e.g. "Electron temperature")
unit	string (7.9.8.1.4)	Units of coordinate (e.g. [eV])
transform	integer (7.9.8.1.3)	Coordinate transformation applied to coordinate values stored in coord. Integer flag: 0=none; 1=log10; 2=ln
spacing	integer (7.9.8.1.3)	Flag for specific coordinate spacing (for optimization purposes). Integer flag: 0=undefined; 1=uniform; ...

Type of: tables_coord:coords (4553)

7.9.8.1.132 coredelta_values

Description of the delta term for a given origin

member	type	description
deltaid	identifier (7.9.8.1.263)	Identifier for the origin of the delta terms (see conventions in the ITM website)
rho_tor	vecflt_type (7.9.8.1.18)	Toroidal flux coordinate (not normalised, equivalent to rho_tor_norm) [m]; Vector (nrho). Time-dependent.
rho_tor_norm	vecflt_type (7.9.8.1.18)	Normalised toroidal flux coordinate values (= rho_tor normalised to the value at the last grid point); Time-dependent; Vector (nrho)
psi	vecflt_type (7.9.8.1.18)	Poloidal flux [Wb], without 1/2pi and such that Bp=|grad psi| /R/2/pi. Time-dependent; Vector (nrho)
volume	vecflt_type (7.9.8.1.18)	Volume enclosed in the flux surface [m^3]; Time-dependent; Vector (nrho)
area	vecflt_type (7.9.8.1.18)	Cross-sectional area of the flux surface [m^2]; Time-dependent; Vector (nrho)
delta_psi	vecflt_type (7.9.8.1.18)	Instant change of the poloidal flux [Wb]. Time-dependent. Vector(nrho).
delta_te	vecflt_type (7.9.8.1.18)	Instant change of the electron temperature [eV]. Time-dependent. Vector(nrho).
delta_ti	matflt_type (7.9.8.1.15)	Instant change of the ion temperature [eV]. Time-dependent. Matrix (nrho,nion).
delta_ne	vecflt_type (7.9.8.1.18)	Instant change of the electron density [m^-3]. Time-dependent. Vector(nrho).
delta_ni	matflt_type (7.9.8.1.15)	Instant change of the ion density [m^-3]. Time-dependent. Matrix (nrho,nion).
impurity(:)	coredelta_values_impurity (7.9.8.1.133)	Array(nimp). Time-dependent
delta_vtor	matflt_type (7.9.8.1.15)	Instant change of the toroidal toroidal velocity [m.s^-1]. Time-dependent. Matrix (nrho,nion).
codeparam	codeparam (7.9.8.1.105)	Code parameters

Type of: coredelta:values (4133)

7.9.8.1.133 coredelta_values_impurity

Description of the delta term for an impurity

member	type	description
delta_tz	matflt_type (7.9.8.1.15)	Instant change of the impurity (multiple charge states) temperature [eV]. Time-dependent. Matrix (nrho,nzimp).
delta_nz	matflt_type (7.9.8.1.15)	Instant change of the impurity (multiple charge states) density [m^-3]. Time-dependent. Matrix (nrho,nzimp).

Type of: coredelta_values:impurity (4235)

7.9.8.1.134 corefast_values

Description of the source terms for a given origin

member	type	description
fastid	identifier (7.9.8.1.263)	Identifier for the origin of the non-thermal contributions (see fast_particle_origin_identifier in the Documentation website under Conventions/Enumerated_datatypes). Time-dependent.
filter	fast_thermal_separation_filter (7.9.8.1.228)	Description of how the fast and the thermal particle populations were separated. Time-dependent.
rho_tor	vecflt_type (7.9.8.1.18)	Toroidal flux coordinate (not normalised, equivalent to rho_tor_norm) [m]; Vector (nrho). Time-dependent.
rho_tor_norm	vecflt_type (7.9.8.1.18)	Normalised toroidal flux coordinate values (= rho_tor normalised to the value at the last grid point). Vector (nrho). Time-dependent.
psi	vecflt_type (7.9.8.1.18)	Poloidal flux at the grid points for 1D profiles [Wb], without 1/2pi and such that Bp=|grad psi| /R/2/pi. Vector (nrho). Time-dependent.
volume	vecflt_type (7.9.8.1.18)	Volume enclosed in the flux surface [m^3]. Vector (nrho). Time-dependent.
area	vecflt_type (7.9.8.1.18)	Cross-sectional area of the flux surface [m^2]. Vector (nrho). Time-dependent.
j	vecflt_type (7.9.8.1.18)	Non thermal current, = average(j.B) / B0, where B0 = corefast/toroid_field/b0 [A.m^-2]. Vector(nrho). Time-dependent.
sigma	vecflt_type (7.9.8.1.18)	Non-thermal induced parallel conductivity [ohm^-1.m^-1]. EXACT DEFINITION PENDING. Vector(nrho). Time-dependent.
ni	matflt_type (7.9.8.1.15)	Non-thermal ion density [m^-3]. Matrix(nrho,nions). Time-dependent.
ne	vecflt_type (7.9.8.1.18)	Non-thermal electron density [m^-3]. Vector(nrho). Time-dependent.
nz	matflt_type (7.9.8.1.15)	Non-thermal impurity density [m^-3]. Matrix(nrho,nimpur). Time-dependent.
pi	matflt_type (7.9.8.1.15)	Non-thermal ion pressure; the flux surface average of the m*v^2/3 moment of the fast particle distribution function [Pa]. Matrix(nrho,nions). Time-dependent.
pe	vecflt_type (7.9.8.1.18)	Non-thermal electron pressure; the flux surface average of the m*v^2/3 moment of the fast particle distribution function [Pa]. Vector(nrho). Time-dependent.
pz	matflt_type (7.9.8.1.15)	Non-thermal impurity total pressure; the flux surface average of the m*v^2/3 moment of the fast particle distribution function [Pa]. Matrix(nrho,nimpur). Time-dependent.
pi_para	matflt_type (7.9.8.1.15)	Non-thermal ion parallel pressure; the flux surface average of the m*v_parallel^2 moment of the fast particle distribution function [Pa]. Matrix(nrho,nions). Time-dependent.
pe_para	vecflt_type (7.9.8.1.18)	Non-thermal electron parallel pressure; the flux surface average of the m*v_parallel^2 moment of the fast particle distribution function [Pa]. Vector(nrho). Time-dependent.
pz_para	matflt_type (7.9.8.1.15)	Non-thermal impurity parallel pressure; the flux surface average of the m*v_parallel^2 moment of the fast particle distribution function [Pa]. Matrix(nrho,nimpur). Time-dependent.
ui	matflt_type (7.9.8.1.15)	Non-thermal ion toroidal velocity [m.s^-1]. Matrix(nrho,nions). Time-dependent.
uz	matflt_type (7.9.8.1.15)	Non-thermal impurity toroidal velocity [m.s^-1]. Matrix(nrho,nimpur). Time-dependent.
codeparam	codeparam (7.9.8.1.105)	Code parameters

Type of: corefast:values (4134)

7.9.8.1.135 corefield

Structure for a main field of core transport equations; Time-dependent;

member	type	description
value	vecflt_type (7.9.8.1.18)	Signal value; Time-dependent; Vector (nrho)
ddrho	vecflt_type (7.9.8.1.18)	Radial derivative (dvalue/drho_tor) [signal_value_unit.m^-1]; Time-dependent; Vector (nrho)
d2drho2	vecflt_type (7.9.8.1.18)	Second order radial derivative (d2value/drho_tor^2) [signal_value_unit.m^-2]; Time-dependent; Vector (nrho)
ddt	vecflt_type (7.9.8.1.18)	Time derivative (dvalue/dtime) [signal_value_unit.s^-1]; Time-dependent; Vector (nrho)
source	string (7.9.8.1.4)	Source of the profile (any comment describing the origin of the profile : code, path to diagnostic signals, massaging, ...); String
flag	integer (7.9.8.1.3)	Flag describing how the profile has been processed : 0-not calculated 1-interpretative; 2-calculated by the transport solver; 3-calculated by a separate code : in that case only, description of the code provided in codeparam at the same level; 4-used value from the previous time step; Time-dependent; Scalar
boundary	boundaryel (7.9.8.1.95)	Boundary condition for the transport equation. Time-dependent.
source_term	sourceel (7.9.8.1.435)	Total source term for the transport equation. Time-dependent.
transp_coef	coretransel (7.9.8.1.154)	Total transport coefficients. Time-dependent.
flux	fluxel (7.9.8.1.233)	Fluxes of the quantity, two definitions. Time-dependent.
flux_dv_surf	vecflt_type (7.9.8.1.18)	Net flux through the magnetic surface, i.e. integral over the magnetic surface area of flux_dv. Time-dependent; Vector (nrho)
time_deriv	vecflt_type (7.9.8.1.18)	Integral of the time derivative term of the transport equation. Time-dependent. Vector (nrho)
codeparam	codeparam (7.9.8.1.105)	Code parameters

Type of: coreprof:ne (4137) I coreprof:te (4137)

7.9.8.1.136 corefieldion

Structure for an ion field of core transport equations; Time-dependent;

member	type	description
value	matflt_type (7.9.8.1.15)	Signal value; Time-dependent; Matrix (nrho,nion)
ddrho	matflt_type (7.9.8.1.15)	Radial derivative (dvalue/drho_tor) [signal_value_unit.m^-1]; Time-dependent; Matrix (nrho,nion)
d2drho2	matflt_type (7.9.8.1.15)	Second order radial derivative (d2value/drho_tor^2) [signal_value_unit.m^-2]; Time-dependent; Matrix (nrho,nion)
ddt	matflt_type (7.9.8.1.15)	Time derivative (dvalue/dtime) [signal_value_unit.s^-1]; Time-dependent; Matrix (nrho,nion)
source	vecstring_type (7.9.8.1.20)	Source of the profile (any comment describing the origin of the profile : code, path to diagnostic signals, massaging, ...); Array of strings (nion)
flag	vecint_type (7.9.8.1.19)	Flag describing how the profile has been processed : 0-not calculated 1-interpretative; 2-calculated by the transport solver; 3-calculated by a separate code : in that case only, description of the code provided in codeparam at the same level; 4-used value from the previous time step; Time-dependent; Vector(nion)
boundary	boundaryion (7.9.8.1.97)	Boundary condition for the transport equation
source_term	sourceion (7.9.8.1.437)	Total source term for the transport equation. Time-dependent.
transp_coef	coretransion (7.9.8.1.156)	Total transport coefficients. Time-dependent.
flux	fluxion (7.9.8.1.235)	Fluxes of the quantity, two definitions. Time-dependent.
flux_dv_surf	matflt_type (7.9.8.1.15)	Net flux through the magnetic surface, i.e. integral over the magnetic surface area of flux_dv. Time-dependent; Matrix(nrho,nion)
time_deriv	matflt_type (7.9.8.1.15)	Integral of the time derivative term of the transport equation. Time-dependent. Matrix (nrho,nion)
codeparam	codeparam (7.9.8.1.105)	Code parameters

Type of: coreprof:ni (4137) I coreprof:ti (4137) I coreprof:vtor (4137)

7.9.8.1.137 corefieldneutral

Structure for a main field of core neutral transport equations; Time-dependent;

member	type	description
value	vecflt_type (7.9.8.1.18)	Signal value; Array1D(nrho). Time-dependent
flux	vecflt_type (7.9.8.1.18)	Net neutral flux through the magnetic surface, positive values correspond to the direction from the center to the edge [s^-1]. Array1D(nrho). Time-dependent;
boundary	boundary_neutrals (7.9.8.1.94)	Boundary condition for the transport equation. Time-dependent.

Type of: coreneutrals_neutraltype:n0 (4253)

7.9.8.1.138 corefieldneutrale

Structure for a main field of core neutral transport equations, (Temperature, with flux as energy); Time-dependent;

member	type	description
value	vecflt_type (7.9.8.1.18)	Signal value; Array1D(nrho). Time-dependent
flux	vecflt_type (7.9.8.1.18)	Net flux of the kinetic energy through the magnetic surface (3/2*E*n*V), positive values correspond to the direction from the center to the edge [W]. Array1D(nrho). Time-dependent;
boundary	boundary_neutrals (7.9.8.1.94)	Boundary condition for the transport equation. Time-dependent.

Type of: coreneutrals_neutraltype:t0 (4253)

7.9.8.1.139 corefieldneutralv

Structure for a main field of core neutral transport equations (without flux variable); Time-dependent;

member	type	description
value	vecflt_type (7.9.8.1.18)	Signal value; Vector(nrho). Time-dependent;
boundary	boundary_neutrals (7.9.8.1.94)	Boundary condition for the transport equation. Time-dependent.

Type of: corefieldneutralv0:poloidal (4243) I corefieldneutralv0:radial (4243) I corefieldneutralv0:toroidal (4243)

7.9.8.1.140 corefieldneutralv0

Neutral velocity

member	type	description
toroidal	corefieldneutralv (7.9.8.1.139)	Neutral velocity in the toroidal direction [m.s^-1]. Positive is anti-clockwise when viewed from above. Time-dependent;
poloidal	corefieldneutralv (7.9.8.1.139)	Velocity of neutrals in the poloidal direction. 0 is directed towards low field side, pi is towards high field side. Positive is anti-clockwise when viewed with low field side at the right. [m.s^-1]. Array3D(nrho,nneut,max_ntype). Time-dependent;
radial	corefieldneutralv (7.9.8.1.139)	Neutral velocity in the radial direction (perpendicular to the magnetic surface), positive is from the centre to the edge [m.s^-1]. Array3D(nrho,nneut,max_ntype). Time-dependent;

Type of: coreneutrals_neutraltype:v0 (4253)

7.9.8.1.141 coreimpurdiag_sum_radiation

member	type	description
line_rad	coreimpurediagsum_type (7.9.8.1.148)	NO DOCS
brem_radrec	coreimpurediagsum_type (7.9.8.1.148)	NO DOCS
sum	coreimpurediagsum_type (7.9.8.1.148)	NO DOCS

Type of: coreimpurediag_sum:radiation (4247)

7.9.8.1.142 coreimpurediag_energy

member	type	description
ionization	coreimpurediagprof_type (7.9.8.1.147)	NO DOCS
recombin	coreimpurediagprof_type (7.9.8.1.147)	NO DOCS
sum	coreimpurediagprof_type (7.9.8.1.147)	NO DOCS

Type of: coreimpurediag_type:energy (4249)

7.9.8.1.143 coreimpurediag_radiation

member	type	description

brem_radrec	coreimpurediagprof_type (7.9.8.1.147)	NO DOCS
sum	coreimpurediagprof_type (7.9.8.1.147)	NO DOCS

Type of: coreimpurediag_type:radiation (4249)

7.9.8.1.144 coreimpurediag_sum

member	type	description
radiation	coreimpurdiag_sum_radiation (7.9.8.1.141)	NO DOCS
energy	coreimpurediag_sum_energy (7.9.8.1.145)	NO DOCS

Type of: coreimpur:diagnosticsum (4135)

7.9.8.1.145 coreimpurediag_sum_energy

member	type	description
ionization	coreimpurediagsum_type (7.9.8.1.148)	NO DOCS
recombin	coreimpurediagsum_type (7.9.8.1.148)	NO DOCS
sum	coreimpurediagsum_type (7.9.8.1.148)	NO DOCS

Type of: coreimpurediag_sum:energy (4247)

7.9.8.1.146 coreimpurediag_type

member	type	description
radiation	coreimpurediag_radiation (7.9.8.1.143)	NO DOCS
energy	coreimpurediag_energy (7.9.8.1.142)	NO DOCS

Type of: coreimpur:diagnostic (4135) I impurity_type:diagnostic (4369)

7.9.8.1.147 coreimpurediagprof_type

member	type	description
profile	matflt_type (7.9.8.1.15)	Profile of the radiation or energy sources. Time-dependent. Array2D (nrho,nzimp or nimp)
integral	matflt_type (7.9.8.1.15)	Running integral over nrho of the radiation or energy sources. Time-dependent. Array2D (nrho,nzimp or nimp)

Type of: coreimpurediag_energy:ionization (4245) I coreimpurediag_energy:recombin (4245) I coreimpurediag_energy:sum (4245) I coreimpurediag_radiation:brem_radrec (4246) I coreimpurediag_radiation:line_rad (4246) I coreimpurediag_radiation:sum (4246)

7.9.8.1.148 coreimpurediagsum_type

member	type	description
profile	vecflt_type (7.9.8.1.18)	Profile of the radiation or energy sources. Time-dependent. Array1D (nrho)
integral	vecflt_type (7.9.8.1.18)	Running integral over nrho of the radiation or energy sources. Time-dependent. Array1D (nrho)

Type of: coreimpurdiag_sum_radiation:brem_radrec (4244) I coreimpurdiag_sum_radiation:line_rad (4244) I coreimpurdiag_sum_radiation:sum (4244) I coreimpurediag_sum_energy:ionization (4248) I coreimpurediag_sum_energy:recom (4248) I coreimpurediag_sum_energy:sum (4248)

7.9.8.1.149 coreneutrals_atomlist

List of the atoms that enter the composition of the neutral species. Vector(natm)

member	type	description
amn	float (7.9.8.1.2)	Atomic mass number; Float
zn	float (7.9.8.1.2)	Nuclear charge; Float
ionimptype	identifier (7.9.8.1.263)	Identifier whether ion in coreprof or impurity in coreimpur.
ionimpindex	integer (7.9.8.1.3)	Index in composition or desc_impur of the corresponding ion or impurity.

Type of: composition_neutrals:atomlist (4227)

7.9.8.1.150 coreneutrals_neutraltype

Array (ntype) over neutral types.

member	type	description
n0	corefieldneutral (7.9.8.1.137)	Neutral density [m^-3]. Time-dependent;
t0	corefieldneutrale (7.9.8.1.138)	Neutral temperature [eV]. Time-dependent;
v0	corefieldneutralv0 (7.9.8.1.140)	Neutral velocity [m.s^-1]. Time-dependent;

Type of: neutral_complex_type:neutraltype (4421)

7.9.8.1.151 coreprofile

Structure for core plasma profile; Time-dependent

member	type	description
value	vecflt_type (7.9.8.1.18)	Signal value; Time-dependent; Vector (nrho)
source	string (7.9.8.1.4)	Source of the profile (any comment describing the origin of the profile : code, path to diagnostic signals, massaging, ...); String

Type of: profiles1d:bpol (4470) I profiles1d:dpedt (4470) I profiles1d:dpi_totdt (4470) I profiles1d:dvprimedt (4470) I profiles1d:e_b (4470) I profiles1d:eparallel (4470) I profiles1d:jni (4470) I profiles1d:joh (4470) I profiles1d:jphi (4470) I profiles1d:jtot (4470) I profiles1d:pe (4470) I profiles1d:pi_tot (4470) I profiles1d:pr_parallel (4470) I profiles1d:pr_perp (4470) I profiles1d:pr_th (4470) I profiles1d:q (4470) I profiles1d:qei (4470) I profiles1d:shear (4470) I profiles1d:sigmapar (4470) I profiles1d:vloop (4470) I profiles1d:zeff (4470) I psi:sigma_par (4472)

7.9.8.1.152 coreprofion

Structure for core plasma ion profile; Time-dependent

member	type	description
value	matflt_type (7.9.8.1.15)	Signal value; Time-dependent; Matrix (nrho,nion)
source	vecstring_type (7.9.8.1.20)	Source of the profile (any comment describing the origin of the profile : code, path to diagnostic signals, massaging, ...); Array of strings (nion)

Type of: profiles1d:mtor (4470) I profiles1d:ns (4470) I profiles1d:pi (4470) I profiles1d:vpol (4470) I profiles1d:wtor (4470)

7.9.8.1.153 coresource_values

Description of the source terms for a given origin

member	type	description
sourceid	identifier (7.9.8.1.263)	Identifier for the origin of the source terms (see conventions in the ITM website)
rho_tor	vecflt_type (7.9.8.1.18)	Toroidal flux coordinate (not normalised, equivalent to rho_tor_norm) [m]; Vector (nrho). Time-dependent.
rho_tor_norm	vecflt_type (7.9.8.1.18)	Normalised toroidal flux coordinate values (= rho_tor normalised to the value at the last grid point); Time-dependent; Vector (nrho)
psi	vecflt_type (7.9.8.1.18)	Poloidal flux [Wb], without 1/2pi and such that Bp=|grad psi| /R/2/pi. Time-dependent; Vector (nrho)
volume	vecflt_type (7.9.8.1.18)	Volume enclosed in the flux surface [m^3]; Time-dependent; Vector (nrho)
area	vecflt_type (7.9.8.1.18)	Cross-sectional area of the flux surface [m^2]; Time-dependent; Vector (nrho)
j	vecflt_type (7.9.8.1.18)	Parallel current source for psi transport equation, = average(j.B) / B0, where B0 = coresource/toroid_field/b0 [A.m^-2]. Vector(nrho). Time-dependent.
sigma	vecflt_type (7.9.8.1.18)	Induced parallel conductivity [ohm^-1.m^-1]. EXACT DEFINITION PENDING. Vector(nrho). Time-dependent.
si	source_ion (7.9.8.1.432)	Particle source for ion density transport equation [m^-3.s^-1]. Time-dependent.
se	source_vec (7.9.8.1.434)	Particle source for electron density transport equation [m^-3.s^-1]. Time-dependent.
sz(:)	source_imp (7.9.8.1.431)	Particle source for impurity density transport equation [m^-3.s^-1]. Vector(nimpur). Time-dependent.
qi	source_ion (7.9.8.1.432)	Heat source for ion heat transport equations [W.m^-3]. Time-dependent.
qe	source_vec (7.9.8.1.434)	Heat source for electron heat transport equation [W.m^-3]. Time-dependent.
qz(:)	source_imp (7.9.8.1.431)	Heat source for impurity heat transport equations [W.m^-3]. Vector(nimpur). Time-dependent.
ui	source_ion (7.9.8.1.432)	Toroidal torque on individual ion species; for toroidal momentum transport equation [kg.m^-1.s^-2]. Time-dependent.

member	type	description
ujxb	source_vec (7.9.8.1.434)	Toroidal JxB torque on bulk plasma; for toroidal momentum transport equation [kg.m^-1.s^-2]. Here J is the return current from fast ion radial currents Jfast=-J. Time-dependent.
codeparam	codeparam (7.9.8.1.105)	Code parameters

Type of: coresource:values (4138)

7.9.8.1.154 coretransel

Structure for the transport coefficients for the transport equation (electrons). Time-dependent;

member	type	description
diff	vecflt_type (7.9.8.1.18)	Diffusion coefficient [m^2.s^-1]. Time-dependent; Vector (nrho)
vconv	vecflt_type (7.9.8.1.18)	Convection coefficient [m.s^-1]. Time-dependent; Vector (nrho)
source	string (7.9.8.1.4)	Source of the profile (any comment describing the origin of the profile : code, path to diagnostic signals, massaging, ...); String

Type of: corefield:transp_coef (4238)

7.9.8.1.155 coretransimp

Structure for the transport coefficients for the transport equation (impurities). Time-dependent;

member	type	description
diff	matflt_type (7.9.8.1.15)	Diffusion coefficient [m^2.s^-1]. Time-dependent; Array2D(nrho,nzimp)
vconv	matflt_type (7.9.8.1.15)	Convection coefficient [m.s^-1]. Time-dependent; Array2D (nrho,nzimp)
source	vecstring_type (7.9.8.1.20)	Source of the profile (any comment describing the origin of the impurity profiles : code, path to diagnostic signals, massaging, ...); Array of strings (nimp)

Type of: impurity_type:transp_coef (4369)

7.9.8.1.156 coretransion

Structure for the transport coefficients for the transport equation (ions). Time-dependent;

member	type	description
diff	matflt_type (7.9.8.1.15)	Diffusion coefficient [m^2.s^-1]. Time-dependent; Matrix (nrho,nion)
vconv	matflt_type (7.9.8.1.15)	Convection coefficient [m.s^-1]. Time-dependent; Matrix (nrho,nion)
source	vecstring_type (7.9.8.1.20)	Source of the profile (any comment describing the origin of the profile : code, path to diagnostic signals, massaging, ...); Array of strings (nion)

Type of: corefieldion:transp_coef (4239)

7.9.8.1.157 coretransp_values

Description of transport term coming from various origins. Array of structure (ntransp)

member	type	description
transportid	identifier (7.9.8.1.263)	Identifier for the origin of the transport terms (see conventions in the ITM website)
rho_tor_norm	vecflt_type (7.9.8.1.18)	Normalised toroidal flux coordinate values (= rho_tor normalised to the value at the last grid point); Time-dependent; Vector (nrho)
rho_tor	vecflt_type (7.9.8.1.18)	Toroidal flux coordinate (not normalised, equivalent to rho_tor_norm) [m]; Vector (nrho). Time-dependent.
psi	vecflt_type (7.9.8.1.18)	Poloidal flux [Wb], without 1/2pi and such that Bp=|grad psi| /R/2/pi. Time-dependent; Vector (nrho)
volume	vecflt_type (7.9.8.1.18)	Volume enclosed in the flux surface [m^3]; Time-dependent; Vector (nrho)
area	vecflt_type (7.9.8.1.18)	Cross-sectional area of the flux surface [m^2]; Time-dependent; Vector (nrho)
sigma	vecflt_type (7.9.8.1.18)	Parallel conductivity [ohm^-1.m^-1]. Time-dependent. Vector(nrho).
ni_transp	ni_transp (7.9.8.1.320)	Transport coefficients for ion density equation. Time-dependent.
ne_transp	ne_transp (7.9.8.1.315)	Transport coefficients for electron density equation. Time-dependent.
nz_transp(:)	transcoefimp (7.9.8.1.490)	Transport coefficients for impurity (multiple charge state) density equation. Time-dependent.
ti_transp	transcoefion (7.9.8.1.491)	Transport coefficients for ion temperature equation. Time-dependent.
te_transp	transcoefel (7.9.8.1.489)	Transport coefficients for electron temperature equation. Time-dependent.

member	type	description
tz_transp(:)	transcoefimp (7.9.8.1.490)	Transport coefficients for impurity (multiple charge state) temperature equation. Time-dependent.
vtor_transp	transcoefvtor (7.9.8.1.492)	Transport coefficients for toroidal velocity equation. Time-dependent.
codeparam	codeparam (7.9.8.1.105)	Code parameters

Type of: coretransp:values (4139)

7.9.8.1.158 current

Description of the IC surface currents on the antenna straps and on passive components.

member	type	description
mpol	vecint_type (7.9.8.1.19)	Poloidal modes, used to describe the spectrum of the antenna current. The poloidal angle is defined from the reference point rz_reference; the angle at a point (R,Z) is given by atan((Z-Zref)/(R-Rref)), where Rref=rz_reference/r and Zref=rz_reference/z. Time-Dependent; Integer(n_poloidal_modes)
ntor	vecint_type (7.9.8.1.19)	Toroidal modes, used to describe the spectrum of the antenna current. Time-Dependent; Integer(n_toroidal_modes)
spectrum	exp1D (7.9.8.1.225)	Spectrum of the total surface current on the antenna strap and passive components expressed in poloidal and toroidal mode [A]. Calculated using a geometrical poloidal angle around the point rz_reference. Time-dependent; exp1D(n_poloidal_modes , n_toroidal_modes)
rz_reference	rz0D (7.9.8.1.386)	Reference point used to define the poloidal angle, e.g. the geometrical centre of the vacuum vessel. Time-dependent; rz0d

Type of: antennaic_setup:current (4183)

7.9.8.1.159 cxmeasure

Measured values

member	type	description
ti	exp1D (7.9.8.1.225)	Ion temperature [eV]. Vector (nchannels)
vtor	exp1D (7.9.8.1.225)	Toroidal velocity [m/s]. Vector (nchannels)
vpol	exp1D (7.9.8.1.225)	Poloidal velocity [m/s]. Vector (nchannels)

Type of: cxdiag:measure (4140)

7.9.8.1.160 cxsetup

diagnostic setup information

member	type	description
amn	vecflt_type (7.9.8.1.18)	Mass of the emmitting impurity. Varies according to channels since they are spanning different lines of sight; Vector (nchannels)
zn	vecflt_type (7.9.8.1.18)	Nuclear charge of the emmitting impurity. Varies according to channels since they are spanning different lines of sight; Vector (nchannels)
position	rzphi1Dexp (7.9.8.1.394)	Position of the measurement. Time-dependent. Vector (nchannels)

Type of: cxdiag:setup (4140)

7.9.8.1.161 data_release

Stores information about each entry available at this version.

member	type	description
shot	integer (7.9.8.1.3)	Shot number = Mass*100+Nuclear_charge.
run	integer (7.9.8.1.3)	Which run number is the active run number for this version.
description	vecstring_type (7.9.8.1.20)	Possible description of why this version of the data is the current version.

Type of: version_ind:data_release (4611)

7.9.8.1.162 datainfo

Generic information on a data item

member	type	description
dataprovider	string (7.9.8.1.4)	Name of the actual data provider (the person who filled the data)
putdate	string (7.9.8.1.4)	Date at which the data has been put in the DB
source	string (7.9.8.1.4)	Exact reference of the data source (e.g. original reference in the native machine data base)
comment	string (7.9.8.1.4)	Any additional comment
cocos	integer (7.9.8.1.3)	COordinates COnventionS followed by this CPO
id	integer (7.9.8.1.3)	CPO id for checking its provenance in the workflow
isref	integer (7.9.8.1.3)	1 if the data can be found in the present data base entry; 2 if the data can be found in a parent data base entry; 0 if no data consistent with the present entry can be found.
whatref	whatref (7.9.8.1.534)	Structure defining a database entry and the CPO occurrence
putinfo	putinfo (7.9.8.1.370)	Level 2 information describing how to retrieve the actual data for the UAL. Not to be filled/used by the ITM user !

Type of: amns:datainfo (4127) I antennas:datainfo (4128) I bb_shield:datainfo (4129) I bolometer:datainfo (4130) I bremsstrahl:datainfo (4131) I compositionc:datainfo (4132) I coredelta:datainfo (4133) I corefast:datainfo (4134) I coreimpur:datainfo (4135) I coreneutrals:datainfo (4136) I coreprof:datainfo (4137) I coresource:datainfo (4138) I coretransp:datainfo (4139) I cxdiag:datainfo (4140) I distribution:datainfo (4141) I distsource:datainfo (4142) I ecediag:datainfo (4143) I edge:datainfo (4144) I efcc:datainfo (4145) I equilibrium:datainfo (4146) I flush:datainfo (4334) I fusiondiag:datainfo (4147) I halphadiag:datainfo (4148) I heat_sources:datainfo (4149) I ironmodel:datainfo (4151) I langmuirdiag:datainfo (4152) I launchs:datainfo (4153) I lineintegraldiag:datainfo (4385) I lithiumdiag:datainfo (4154) I magdiag:datainfo (4155) I mhd:datainfo (4156) I msediag:datainfo (4157) I nbi:datainfo (4158) I neoclassic:datainfo (4159) I ntm:datainfo (4160) I orbit:datainfo (4161) I pellets:datainfo (4162) I pfsystems:datainfo (4163) I power_conv:datainfo (4165) I reflectomet:datainfo (4166) I rfadiag:datainfo (4167) I sawteeth:datainfo (4168) I scenario:datainfo (4169) I solcurdiag:datainfo (4170) I temporary:datainfo (4171) I toroidfield:datainfo (4173) I tsdiag:datainfo (4174) I turbulence:datainfo (4175) I wall:datainfo (4176) I waves:datainfo (4177)

7.9.8.1.163 desc_coils

Description of the coils

member	type	description
name	string (7.9.8.1.4)	Name of coil.
res	float (7.9.8.1.2)	Coil resistance [Ohm]
nturns	integer (7.9.8.1.3)	number of turns inside the coil
closed	string (7.9.8.1.4)	Identify whether the coil is closed (y) or open (n). For closed coils there is no need to replicate the first r,z,phi point as last point
edges(:)	edges (7.9.8.1.212)	Edges defining the coil volume faces. Structure array. Replicate this edge structure N-times for N-edge cross sections. Use just one for wire coil approximation.

Type of: coil:desc_coils (4211)

7.9.8.1.164 desc_impur

Description of the impurities (list of ion species and possibly different charge states). OBSOLESCENT.

member	type	description
amn	vecflt_type (7.9.8.1.18)	Atomic mass number of the impurity; Vector (nimp)
zn	vecint_type (7.9.8.1.19)	Nuclear charge of the impurity; Vector (nimp)
i_ion	vecint_type (7.9.8.1.19)	Index of the impurity species in the coreprof ion species ordering. Vector (nimp)
nzimp	vecint_type (7.9.8.1.19)	Number of charge states (or bundles) considered for each impurity species. Vector (nimp)
zmin	matint_type (7.9.8.1.16)	Minimum Z of impurity ionisation state bundle. Matrix (nimp,max_nzimp)
zmax	matint_type (7.9.8.1.16)	Maximum Z of impurity ionisation state bundle. If no bundle, zmax=zmin. Matrix (nimp,max_nzimp)
label	vecstring_type (7.9.8.1.20)	Label for the impurities - note that the charge state is not included; String Vector (nimp)

Type of: coredelta:desc_impur (4133) I corefast:desc_impur (4134) I coreimpur:desc_impur (4135) I coreneutrals:desc_impur (4136) I coreprof:desc_impur (4137) I coresource:desc_impur (4138) I coretransp:desc_impur (4139) I neoclassic:desc_impur (4159)

7.9.8.1.165 desc_iron

Description of the iron segments

member	type	description
name	vecstring_type (7.9.8.1.20)	Name of circuit. Array of strings (ncircuit).
id	vecstring_type (7.9.8.1.20)	ID of circuit. Array of strings (ncircuit).
permeability	permeability (7.9.8.1.348)	Permeability model (can be different for each iron segment)
geom_iron	geom_iron (7.9.8.1.255)	Geometry of the iron segments

Type of: ironmodel:desc_iron (4151)

7.9.8.1.166 desc_pfcoils

Description of the coils

member	type	description
name	vecstring_type (7.9.8.1.20)	Name of coil. Array of strings (ncoils)
id	vecstring_type (7.9.8.1.20)	ID of coil. Array of strings (ncoils)
res	vecflt_type (7.9.8.1.18)	Coil resistance [Ohm]; Vector (ncoils)
emax	vecflt_type (7.9.8.1.18)	Maximum Energy to be dissipated in coils [J]; Vector (ncoils)
structure_cs	structure_cs (7.9.8.1.445)	Detailed description of the coil structure, for coils that are part of the central solenoid.
pol_flux_cs	float (7.9.8.1.2)	Maximum poloidal flux available in the Central Solenoid for a plasma pulse [Wb].
nelement	vecint_type (7.9.8.1.19)	Number of elements used to describe a coil; Vector (ncoils)
pfelement	pfelement (7.9.8.1.351)	Axisymmetric conductor description

Type of: pfcoils:desc_pfcoils (4453)

7.9.8.1.167 desc_supply

Description of the power supplies

member	type	description
name	vecstring_type (7.9.8.1.20)	Name of the supply; Array of strings (nsupplies)
id	vecstring_type (7.9.8.1.20)	ID of the supply; Array of strings (nsupplies)
type	vecstring_type (7.9.8.1.20)	Type of supply; Array of strings (nsupplies)
delay	vecflt_type (7.9.8.1.18)	Pure delay in the supply [s]; Vector (nsupplies)
filter	filter (7.9.8.1.229)	Laplace proper filter
imin	vecflt_type (7.9.8.1.18)	Minimum current [A]; Vector (nsupplies)
imax	vecflt_type (7.9.8.1.18)	Maximum current [A]; Vector (nsupplies)
res	vecflt_type (7.9.8.1.18)	Supply internal resistance [Ohm]; Vector (nsupplies)
umin	vecflt_type (7.9.8.1.18)	Minimum voltage [V]; Vector (nsupplies)
umax	vecflt_type (7.9.8.1.18)	Maximum voltage [V]; Vector (nsupplies)
emax	vecflt_type (7.9.8.1.18)	Maximum Energy to be dissipated in supply [J]; Vector (nsupplies)

Type of: pfsupplies:desc_supply (4459)

7.9.8.1.168 diag_func

Structure to provide the description on the detctor used and store the transfer matrix of the detector for that l.o.s.

member	type	description
description	string (7.9.8.1.4)	Short description of the detector with reference to the number of cells (ncells).
transf_mat	matflt_type (7.9.8.1.15)	Transfer matrix of the detector. Each l.o.s. might have a dedicated detector response function and energy resolution (and number of cells). Time-independent. Matrix (ncells,nenergy)

Type of: fusiondiag_detect_ct_energy:diag_func (4350)

7.9.8.1.169 dist_collisional_transfer_0d

Collisional exchange with the impurities. The ion indexing should match the one in distribution/compositions/impurities/z
Time-dependent; Vector(nzimp)

member	type	description
power_th	float (7.9.8.1.2)	Collisional power to the thermal particle population [W]; Time-dependent; Scalar
power_fast	float (7.9.8.1.2)	Collisional power to the fast particle population [W]; Time-dependent; Scalar
torque_th	float (7.9.8.1.2)	Collisional toroidal torque to the thermal particle population [N.m]; Time-dependent; Scalar
torque_fast	float (7.9.8.1.2)	Collisional toroidal torque to the fast particle population [N.m]; Time-dependent; Scalar

Type of: dist_global_param:collisions_e (4281) I dist_global_param:collisions_i (4281) I dist_global_param_collisions_z:charge_s
(4282)

7.9.8.1.170 dist_collisional_transfer_1d

Collisional exchange from the background electrons to the distribution function. Time-dependent

member	type	description
power_th	vecflt_type (7.9.8.1.18)	Flux surface averaged collisional power density to the thermal particle population [W.m^-3]; Time-dependent; Vector(npsi)
power_fast	vecflt_type (7.9.8.1.18)	Flux surface averaged collisional power density to the fast particle population [W.m^-3]; Time-dependent; Vector(npsi)
torque_th	vecflt_type (7.9.8.1.18)	Flux surface averaged collisional toroidal torque density to the thermal particle population [N.m^-2]; Time-dependent; Vector(npsi)
torque_fast	vecflt_type (7.9.8.1.18)	Flux surface averaged collisional toroidal torque density to the fast particle population [N.m^-2]; Time-dependent; Vector(npsi)

Type of: dist_profile_values_1d:collisions_e (4284) I dist_profile_values_1d:collisions_i (4284) I dist_profiles_1d:collisions_e (4287) I dist_profiles_1d:collisions_i (4287) I dist_profiles_1d_collisions_z:charge_state (4288)

7.9.8.1.171 dist_collisional_transfer_2d

Collisional exchange from the background electrons to the distribution function. Time-dependent

member	type	description
power_th	matflt_type (7.9.8.1.15)	Collisional power density to the thermal particle population [W.m^-3]; Time-dependent; Matrix(n_coord1,n_coord2)
power_fast	matflt_type (7.9.8.1.15)	Collisional power density to the fast particle population [W.m^-3]; Time-dependent; Matrix(n_coord1,n_coord2)
torque_th	matflt_type (7.9.8.1.15)	Collisional toroidal torque density to the thermal particle population [N.m^-2]; Time-dependent; Matrix(n_coord1,n_coord2)
torque_fast	matflt_type (7.9.8.1.15)	Collisional toroidal torque density to the fast particle population [N.m^-2]; Time-dependent; Matrix(n_coord1,n_coord2)

Type of: dist_profile_values_2d:collisions_e (4285) I dist_profile_values_2d:collisions_i (4285) I dist_profiles2d_collisions_z:char
(4286) I dist_profiles_2d:collisions_e (4289) I dist_profiles_2d:collisions_i (4289)

7.9.8.1.172 dist_distrivec_distfunc_fexp_param

Parameters used to defined the grid coordinates. Time-dependent

member	type	description
equatorial	equatorial_plane (7.9.8.1.221)	Description of the equatorial plane or any other omnigeuous surfaces. Time-dependent
temperature	vecflt_type (7.9.8.1.18)	Reference temperature profile (eV); on the grid in /distsource/source/profiles_1d/rho_tor. Used to define the local thermal energy and the thermal velocity. Time-dependent; Vector(npsi)

Type of: f_expansion:parameters (4330)

7.9.8.1.173 dist_ff

Distribution function of e.g. ions, or electrons; the density of particles in the velocity space, the real space and spin state. The grid is split into topological regions, which could overlap in coordiante space (i.e. one coordinated can correspond to more than one orbit). The number of topological region is given by nregion_topo. For nregion_topo=2 the topology should be that of a high aspect ratio tokamak with two topological regions, where the passing orbits moving counter to the plasma current are stored in region_topo=2 and all other orbits are stored in nregion_topo=1. For nregion_topo ¿ 2 (e.g. for spherical tokamaks) the topology should be described in the field topology.

member	type	description
grid_info	dist_grid_info (7.9.8.1.180)	Specification of grids used in topo_regions. Grid coordinates could either be invariants of motion, or information at single point along orbit, e.g. xi and s for grid_coord=3. This point should always be on a so-called omnigenous surface (a generalised equitorial plane); grad(psi) x grad(B) = 0. All closed orbits cross omnigenous surfaces at least two times. The omnigenous surfaces are described in omnigen_surf.
topo_regions(:)	topo_regions (7.9.8.1.486)	List with distribution function in each topological region; Time-dependent. Structure array(nregion_topo)

Type of: dist_func:f_expan_topo (4277)

7.9.8.1.174 dist_func

Distribution functions. The total distribution total distribution can either be given by the a set of markers/test particles (in markers), or by a gridded function (dist_expand). Note that the gridded distribution can be written as sum of successive approximations, where each term is given by an element in the vector dist_expand. Finally, the distribution can be written as a sum of a marker distribution and a gridded distribution, e.g. for delta-f Monte Carlo solution. Time-dependent

member	type	description
is_delta_f	integer (7.9.8.1.3)	If is_delta_f=1, then the distribution represents the deviation from a Maxwellian; is_delta_f=0, then the distribution represents all particles, i.e. the full-f solution. Time-dependent
markers	weighted_markers (7.9.8.1.533)	Distribution represented by a set of markers (test particles). Time-dependent
f_expan_topo(:)	dist_ff (7.9.8.1.173)	TO BE REMOVED. KEPT TEMPORARILY AS AN ALTERNATIVE TO f_expansion. [Distribution function, f, expanded into a vector of successive approximations (topology-based formulation, without the grid-cpo). The first element in the vector (f_expansion(1)) is the zeroth order distribution function, while the K:th elemnet in the vector (f_expansion(K)) is the K:th correction, such that the total distribution function is a sum over all elements in the f_expansion vector. Time-dependent. Structure array(Nf_expansion)]. Time-dependent
f_expansion(:)	f_expansion (7.9.8.1.227)	Distribution function, f, expanded into a vector of successive approximations. The first element in the vector (f_expansion(1)) is the zeroth order distribution function, while the K:th element in the vector (f_expansion(K)) is the K:th correction, such that the total distribution function is a sum over all elements in the f_expansion vector. Time-dependent. Structure array(Nf_expansion)

Type of: distri_vec:dist_func (4297)

7.9.8.1.175 dist_geometry_0d

Geometrical constants

member	type	description
mag_axis	rz0D (7.9.8.1.386)	Position of the magnetic axis [m]. Time-dependent; Scalar
toroid_field	b0r0 (7.9.8.1.82)	Characteristics of the vacuum toroidal field. Used to define the radial coordiante rho_tor and to measure the current drive. Time-dependent; Scalar

Type of: dist_global_param:geometry (4281)

7.9.8.1.176 dist_geometry_1d

Grids and metric information; including rho_tor, psi, area and volume. Time-dependent

member	type	description
rho_tor	vecflt_type (7.9.8.1.18)	Toroidal flux coordinate [m]. Defined as sqrt((phi-phi_axis)/pi/B0), where B0=../global_param/toroid_field/b0, phi is the toroidal flux and phi_axis is the toroidal flux at the magnetic axis. Time-dependent; Vector (npsi)
rho_tor_norm	vecflt_type (7.9.8.1.18)	The toroidal flux coordinate normalised to be zero at the axis and unity at the last closed flux surface, or last available fluxsurface if the last closed flux surface is not defined. Time-dependent; Vector (npsi)
psi	vecflt_type (7.9.8.1.18)	Poloidal flux at the grid points for 1D profiles [Wb], without 1/2pi and such that Bp=|grad psi| /R/2/pi. Time-dependent; Vector (npsi)
volume	vecflt_type (7.9.8.1.18)	Volume enclosed by the flux surface [m^3]; Time-dependent; Vector (npsi)
area	vecflt_type (7.9.8.1.18)	Cross-sectional area of the flux surface [m^2]; Time-dependent; Vector (npsi)

Type of: dist_profiles_1d:geometry (4287)

7.9.8.1.177 dist_geometry_2d

Grids and metric information; including R, Z, rho_tor, psi, theta_geom and theta_strt. The grid has to be rectangular in a pair of these coordinates; this is specified in coord_type. Time-dependent

member	type	description
coord_type	integer (7.9.8.1.3)	0: Rectangular grid in the (R,Z) coordinates; 1: Rectangular grid in the (rho_tor,theta_geom) coordinates; 2: Rectangular grid in the (rho_tor,theta_straight) coordinates.
r	matflt_type (7.9.8.1.15)	Major radius coordinate [m]; Time-dependent; Matrix (n_coord1,n_coord2)
z	matflt_type (7.9.8.1.15)	Vertical coordinate [m]; Time-dependent; Matrix (n_coord1,n_coord2)
rho_tor	matflt_type (7.9.8.1.15)	Toroidal flux coordinate [m]. Defined as sqrt((phi-phi_axis)/pi/B0), where B0=../global_param/toroid_field/b0, phi is the toroidal flux and phi_axis is the toroidal flux at the magnetic axis. Time-dependent; Matrix (n_coord1,n_coord2)
psi	matflt_type (7.9.8.1.15)	Poloidal flux at the grid points for 1D profiles [Wb], without 1/2pi and such that Bp=|grad psi| /R/2/pi. Time-dependent; Matrix (n_coord1,n_coord2)
theta_geom	matflt_type (7.9.8.1.15)	Geometrical poloidal angle [rad]; Time-dependent; Matrix (n_coord1,n_coord2)
theta_strt	matflt_type (7.9.8.1.15)	Straight field line poloidal angle [rad]; Time-dependent; Matrix (n_coord1,n_coord2)

Type of: dist_profiles_2d:geometry (4289)

7.9.8.1.178 dist_global_param

Global parameters; spatial constants, volume integrated quantities and quantities averaged over the cross-sectional area. Here the dimensions used refer to: nion - size of distribution/compositions/ions; nimpur - size of distribution/compositions/impurities; nzimp - size of distribution/compositions/impurities/zmin.

member	type	description
geometry	dist_geometry_0d (7.9.8.1.175)	Geometrical constants
state	dist_state_0d (7.9.8.1.190)	Algebraic moments of the distribution function integrated over the plasma volume, e.g. total number of particles, energy etc. Time-dependent
collisions_e	dist_collisional_transfer_0d (7.9.8.1.169)	Collisional exchange with the electrons. Time-dependent
collisions_i(:)	dist_collisional_transfer_0d (7.9.8.1.169)	Collisional exchange with each ion species. The ion indexing should match the one in /distribution/compositions/ions.Time-dependent; Vector(nion)
collisions_z(:)	dist_global_param_collisions_z (7.9.8.1.179)	Collisional exchange with each impurity species. The ion indexing should match the one in /distribution/compositions/impurities. Time-dependent; Vector(nimpur)
sources(:)	dist_sources_0d (7.9.8.1.187)	Vector of volume integrated sources and sinks of particles, momentum and power included in the Fokker-Planck modelling. The physical meaning of each source term is specified through the identifier ./sources/type. Note that it is possible to store multiple source terms with the same value for ./source/type. Time-dependent; Scalar

Type of: distri_vec:global_param (4297)

7.9.8.1.179 dist_global_param_collisions_z

Collisional exchange with each impurity species. The ion indexing should match the one in /distribution/compositions/imp
Time-dependent

member	type	description
charge_state(:)	dist_collisional_transfer_0d (7.9.8.1.169)	Collisional exchange with the impurities. The ion indexing should match the one in distribution/compositions/impurities/zmin. Time-dependent; Vector(nzimp)

Type of: dist_global_param:collisions_z (4281)

7.9.8.1.180 dist_grid_info

Specification of grids used in topo_regions. Grid coordinates could either be invariants of motion, or information at single point along orbit, e.g. xi and s for grid_coord=3. This point should always be on a so-called omnigenous surface (a generalised equitorial plane); grad(psi) x grad(B) = 0. All closed orbits cross omnigenous surfaces at least two times. The omnigenous surfaces are described in omnigen_surf.

member	type	description
grid_type	integer (7.9.8.1.3)	Type of grid: 1=unstructured grid; 2=structured non-rectangular grid, here ndim11=ndim12=ndim13, ndim21=ndim22=ndim23, ndim31=ndim32=ndim33; 3=rectangular grid, where grid coordinates are stored in the vectors dim1(1:ndim1,1,1), dim2(1,1:ndim2,1), dim3(1,1,1:ndim3)
ngriddim	integer (7.9.8.1.3)	Number of grid dimension. For ngriddim=2 the grid is specified by dim1 and dim2 only, while dim3, dim4, dim5, dim6 can be ignored (should not be allocated). For ngriddim=3 also dim3 is used to describe the grid etc. E.g. if your distribution is given by the three variables the poloidal flux, perpendicular and parallel velocities, then ngriddim=3 and grid_coord(1)=15, grid_coord(1)=16, grid_coord(3)=6.
grid_coord	vecint_type (7.9.8.1.19)	Identifies the coordinates specifies in dim1, dim2, dim3, dim4, dim5, and dim6. grid_coord(K) describes the coordinate representaed in dimK, for K=1,2...6. The possible coordinates are: 1=R, Major radius [m]; 2=Z, Vertical position [m]; 3=X, first cartesian coordinate in the horizontal plane [m]; 4=Y, second cartesian coordinate in the horizontal plane (grad(X) x grad(Y) = grad(Z)) [m]; 5=phi, toroidal angle [rad]; 6=psi, poloidal magnetic flux [T*m^2]; 7=rhotor, the square root of the toroidal flux; 8=theta, geometrical poloidal angle [rad]; 9=theta_b, Boozer poloidal angle [rad]; 10=vx, velocity in the x-direction [m/s]; 11=vy, velocity in the y-direction [m/s]; 12=vz, velocity in the z-direction [m/s]; 13=vel, total velocity [m/s]; 14=vphi, velocity in the phi-direction [m/s]; 15=vpar, velocity in the parallel direction [m/s]; 16=vperp, velocity in the perpendicular direction [m/s]; 17=E, Hamiltonian energy [J]; 18=Pphi, canonical toroidal angular momentum [kg m^2/s]; 19=mu, magnetic moment [J/T]; 20=Lambda=mu/E [1/T]; 21=pitch=vpar/v [-]; 22=s, the position of the omnigenous plane (generalised equitorial plane) as described by the fields omnigen_surf%s and omnigen_surf%rz; 23=particle spin; 24=n_Legendre, the index of the Legendre polynomial of the pitch, e.g. if the k:th component of dim3(1,1,k,1,1,1)=5 then this refer to the 5:th Legendre polynomial P_5(xi). Vector (6)
thin_orbits	integer (7.9.8.1.3)	Specifies if guiding centre orbits are thin. Note: only used for orbit averaged distribution functions. For thin_orbits=1 the orbit are considered thin, i.e. each orbit is bound to follow a single flux surface; for thin_orbits=0 the orbits are asumed to follow guiding centre trajectories. E.g. thin_orbits=0 using constants of motion as given in a generalised equitorial plane, then the orbit outside the equitorial plane are described by the guiding centre equations of motion.
topology	string (7.9.8.1.4)	Description of the topology of the grid. NOTE: only used for nregion_topo>2.
omnigen_surf(:)	omnigen_surf (7.9.8.1.331)	List of omnigeuous magnetic surfaces to which the s-coordinates in grid_coord refer. NOTE: only used for gridcoord=3. NOTE: all guiding centre orbits intersect at least one omnigeuous (or stagnation) surfaces, i.e. the omnigeuous generalised the equitorial plane (the midplane). nsurfs=Number of omnigenous surfaces. Structure array(nregion_topo)

Type of: dist_ff:grid_info (4276)

7.9.8.1.181 dist_profile_values_1d

1D profiles; includes flux surface averaged quantities. Here the dimensions used refer to: npsi - size of the internal radial grid defined by rho_tor; nion - size of distribution/compositions/ions; nimpur - size of distribution/compositions/impurities; nzimp - size of distribution/compositions/impurities/zmin. Time-dependent

member	type	description
state	dist_state_1d (7.9.8.1.191)	Fluid moments describing the state of the distribution; calculated from the distribution. Time-dependent
collisions_e	dist_collisional_transfer_1d (7.9.8.1.170)	Collisional exchange from the background electrons to the distribution function. Time-dependent
collisions_i(:)	dist_collisional_transfer_1d (7.9.8.1.170)	Collisional exchange from each background ion speices to the distribution function. Time-dependent; Vector (nions)
collisions_z(:)	dist_profiles_1d_collisions_z (7.9.8.1.185)	Collisional exchange from each background impurities species to the distribution function. Time-dependent; Vector (nimpur)
sources(:)	dist_sources_1d (7.9.8.1.188)	Vector of flux surface averaged sources and sinks of particles, momentum and power included in the Fokker-Planck modelling. The physical meaning of each source term is specified through the identifier ./sources/type. Note that it is possible to store multiple source terms with the same value for source/type. Time-dependent; Vector(n_source_terms)

Type of: dist_profiles_1d:cntr_passing (4287) I dist_profiles_1d:co_passing (4287) I dist_profiles_1d:trapped (4287)

7.9.8.1.182 dist_profile_values_2d

2D profiles in the poloidal plane; includes velocity space integrated quantities. Time-dependent

member	type	description
state	dist_state_2d (7.9.8.1.192)	Fluid moments describing the state of the distribution; calculated from the distribution. Time-dependent
collisions_e	dist_collisional_transfer_2d (7.9.8.1.171)	Collisional exchange from the background electrons to the distribution function. Time-dependent
collisions_i(:)	dist_collisional_transfer_2d (7.9.8.1.171)	Collisional exchange from each background ion speices to the distribution function. Time-dependent; Vector (nions)
collisions_z(:)	dist_profiles2d_collisions_z (7.9.8.1.183)	Collisional exchange from each background impurities species to the distribution function. Time-dependent; Vector (nimpur)

Type of: dist_profiles_2d:cntr_passing (4289) I dist_profiles_2d:co_passing (4289) I dist_profiles_2d:trapped (4289)

7.9.8.1.183 dist_profiles2d_collisions_z

Collisional exchange from each background impurities species to the distribution function. Time-dependent;

member	type	description
charge_state(:)	dist_collisional_transfer_2d (7.9.8.1.171)	Collisional exchange from each charge state (or bundled charge state) to the distribution function. Time-dependent; Vector (nzimp)

Type of: dist_profile_values_2d:collisions_z (4285) I dist_profiles_2d:collisions_z (4289)

7.9.8.1.184 dist_profiles_1d

1D profiles; includes flux surface averaged quantities. Here the dimensions used refer to: npsi - size of the internal radial grid defined by rho_tor; nion - size of distribution/compositions/ions; nimpur - size of distribution/compositions/impurities; nzimp - size of distribution/compositions/impurities/zmin. Time-dependent

member	type	description
geometry	dist_geometry_1d (7.9.8.1.176)	Grids and metric information; including rho_tor, psi, area and volume. Time-dependent
state	dist_state_1d (7.9.8.1.191)	Fluid moments describing the state of the distribution; calculated from the distribution. Time-dependent
collisions_e	dist_collisional_transfer_1d (7.9.8.1.170)	Collisional exchange from the background electrons to the distribution function. Time-dependent
collisions_i(:)	dist_collisional_transfer_1d (7.9.8.1.170)	Collisional exchange from each background ion speices to the distribution function. Time-dependent; Vector (nions)
collisions_z(:)	dist_profiles_1d_collisions_z (7.9.8.1.185)	Collisional exchange from each background impurities species to the distribution function. Time-dependent; Vector (nimpur)
thermalised	dist_thermalised_1d (7.9.8.1.193)	Representation of the flux surface averaged source of thermal particles, momentum and energy due to thermalisation. Here thermalisation refers to non-thermal particles, sufficiently assimilated to the thermal background to be re-categorised as thermal particles. Note that this source may also be negative if thermal particles are being accelerated such that they form a distinct non-thermal contribution, e.g. due run-away of RF interactions.
sources(:)	dist_sources_1d (7.9.8.1.188)	Vector of flux surface averaged sources and sinks of particles, momentum and power included in the Fokker-Planck modelling. The physical meaning of each source term is specified through the identifier ./sources/type. Note that it is possible to store multiple source terms with the same value for source/type. Time-dependent; Vector(n_source_terms)
trapped	dist_profile_values_1d (7.9.8.1.181)	Flux surface averaged profile evaluated using the trapped particle part of the distribution.
co_passing	dist_profile_values_1d (7.9.8.1.181)	Flux surface averaged profile evaluated using the co-current passing particle part of the distribution.
cntr_passing	dist_profile_values_1d (7.9.8.1.181)	Flux surface averaged profile evaluated using the counter-current passing particle part of the distribution.

Type of: distri_vec:profiles_1d (4297)

7.9.8.1.185 dist_profiles_1d_collisions_z

Collisional exchange from each background impurities species to the distribution function. Time-dependent;

member	type	description
charge_state(:)	dist_collisional_transfer_1d (7.9.8.1.170)	Collisional exchange from each charge state (or bundled charge state) to the distribution function. Time-dependent; Vector (nzimp)

Type of: dist_profile_values_1d:collisions_z (4284) I dist_profiles_1d:collisions_z (4287)

7.9.8.1.186 dist_profiles_2d

2D profiles in the poloidal plane; includes velocity space integrated quantities. Time-dependent

member	type	description
geometry	dist_geometry_2d (7.9.8.1.177)	Grids and metric information; including R, Z, rho_tor, psi, theta_geom and theta_strt. The grid has to be rectangular in a pair of these coordinates; this is specified in coord_type. Time-dependent
state	dist_state_2d (7.9.8.1.192)	Fluid moments describing the state of the distribution; calculated from the distribution. Time-dependent

member	type	description
collisions_e	dist_collisional_transfer_2d (7.9.8.1.171)	Collisional exchange from the background electrons to the distribution function. Time-dependent
collisions_i(:)	dist_collisional_transfer_2d (7.9.8.1.171)	Collisional exchange from each background ion speices to the distribution function. Time-dependent; Vector (nions)
collisions_z(:)	dist_profiles2d_collisions_z (7.9.8.1.183)	Collisional exchange from each background impurities species to the distribution function. Time-dependent; Vector (nimpur)
trapped	dist_profile_values_2d (7.9.8.1.182)	2D profiles evaluated using the trapped particle part of the distribution.
co_passing	dist_profile_values_2d (7.9.8.1.182)	2D profiles evaluated using the co-current passing particle part of the distribution.
cntr_passing	dist_profile_values_2d (7.9.8.1.182)	2D profiles evaluated using the counter-current passing particle part of the distribution.

Type of: distri_vec:profiles_2d (4297)

7.9.8.1.187 dist_sources_0d

Volume integrated source included in the Fokker-Planck model.

member	type	description
source_ref	dist_sources_reference (7.9.8.1.189)	Reference identifying the origin and type of source; Time-dependedent
particle	float (7.9.8.1.2)	Source (or sink) rate of particles [1/s]; Time-dependedent; Scalar
momentum	float (7.9.8.1.2)	Source (or sink) rate of toroidal angular momentum [Nm/s]; Time-dependedent; Scalar
energy	float (7.9.8.1.2)	Source (or sink) rate of energy [J/s]; Time-dependedent; Scalar

Type of: dist_global_param:sources (4281)

7.9.8.1.188 dist_sources_1d

Flux surface averaged source included in the Fokker-Planck model.

member	type	description
source_ref	dist_sources_reference (7.9.8.1.189)	Reference identifying the origin and type of source; Time-dependedent
particle	vecflt_type (7.9.8.1.18)	Source (or sink) rate of particles density [1/s/m**3]; Time-dependedent; Vector (npsi)
momentum	vecflt_type (7.9.8.1.18)	Source (or sink) rate of toroidal angular momentum density [Nm/s/m**3]; Time-dependedent; Vector (npsi)
energy	vecflt_type (7.9.8.1.18)	Source (or sink) rate of energy density [J/s/m**3]; Time-dependedent; Vector (npsi)

Type of: dist_profile_values_1d:sources (4284) I dist_profiles_1d:sources (4287)

7.9.8.1.189 dist_sources_reference

Volume integrated source included in the Fokker-Planck model.

member	type	description
type	identifier (7.9.8.1.263)	Identifier for sources and sinks in Fokker-Planck solver; type.flag=1 for wave source, type.flag=2 for particle source, etc (see fokker_planck_source_identifier_definition in the Documentation website under Conventions/Enumerated_datatypes); Time-dependedent
index_waveid	vecint_type (7.9.8.1.19)	Index pointing to /distribution/distri_vec/wave_id[index_waveid] from which the source is taken. Time-dependedent; Vector (npsi)
index_srcid	vecint_type (7.9.8.1.19)	Index pointing to /distribution/distri_vec/source_id[index_waveid] from which the source is taken. Time-dependedent; Vector (npsi)

Type of: dist_sources_0d:source_ref (4290) I dist_sources_1d:source_ref (4291)

7.9.8.1.190 dist_state_0d

Algebraic moments of the distribution function integrated over the plasma volume, e.g. total number of particles, energy etc. Time-dependent

member	type	description
n_particles	float (7.9.8.1.2)	Number of particles in the distribution; the volume integral of the density (note: this is the number of real particles and not markers); Time-dependent

member	type	description
n_part_fast	float (7.9.8.1.2)	Number of fast particles in the distribution; the volume integral of the fast particle density (note: this is the number of real particles and not markers); Time-dependent
enrg	float (7.9.8.1.2)	Total energy distribution [J]; Time-dependent
enrg_fast	float (7.9.8.1.2)	Total energy of the fast particle distribution [J]; Time-dependent
enrg_fast_pa	float (7.9.8.1.2)	Parallel energy of the fast particle distribution [J]; Time-dependent
momentm_fast	float (7.9.8.1.2)	Kinetic toroidal angular momentum of the fast ions [Nms]; Time-dependent; Vector (npsi)
current_dr	float (7.9.8.1.2)	Toroidal non-inductive current drive [A]; Time-dependent.
torque_jrxb	float (7.9.8.1.2)	Toroidal torque due to radial currents [N.m]; Time-dependent.

Type of: dist_global_param:state (4281)

7.9.8.1.191 dist_state_1d

Fluid moments describing the state of the distribution; calculated from the distribution. Time-dependent

member	type	description
dens	vecflt_type (7.9.8.1.18)	Flux surface averaged particle density (including both thermal and fast particles) [1/m^3]; Time-dependent; Vector (npsi)
dens_fast	vecflt_type (7.9.8.1.18)	Flux surface averaged fast particle density [1/m^3]; Time-dependent; Vector (npsi)
pres	vecflt_type (7.9.8.1.18)	Scalar pressure (including both thermal and fast particles) [J/m^3]. Related to the energy content, W, according to: pres=2*W/3. Time-dependent; Vector (npsi)
pres_fast	vecflt_type (7.9.8.1.18)	Scalar pressure of the fast particles [J/m^3]. Related to the fast particle energy content, Wf, according to: pres_fast=2*Wf/3. Time-dependent; Vector (npsi)
pres_fast_pa	vecflt_type (7.9.8.1.18)	Parallel pressure of the fast particles [J/m^3]. Related to the fast particle parallel energy content, Wfpar, according to: pres_fast_pa=2*Wfpar. Time-dependent; Vector (npsi)
momentm_fast	vecflt_type (7.9.8.1.18)	Kinetic toroidal angular momentum density of the fast ions [Ns/m^2]; Time-dependent; Vector (npsi)
current	vecflt_type (7.9.8.1.18)	Total toroidal driven current density (including electron and thermal ion back-current, or drag-current) [A/m^3]; Time-dependent; Vector (npsi)
current_fast	vecflt_type (7.9.8.1.18)	Flux surface averaged toroidal current density of fast (non-thermal) particles (excluding electron and thermal ion back-current, or drag-current) [A.m^-2]; Time-dependent; Vector (npsi).
torque_jrxb	vecflt_type (7.9.8.1.18)	Toroidal torque density due to radial currents, excluding radial current due to neoclassical effect [N/m^2]; Time-dependent; Vector (npsi)

Type of: dist_profile_values_1d:state (4284) I dist_profiles_1d:state (4287)

7.9.8.1.192 dist_state_2d

Fluid moments describing the state of the distribution; calculated from the distribution. Time-dependent

member	type	description
dens	matflt_type (7.9.8.1.15)	Particle density (including both thermal and fast particles) [1/m^3]; Time-dependent; Matrix (n_coord1, n_coord2)
dens_fast	matflt_type (7.9.8.1.15)	Fast particle density [1/m^3]; Time-dependent; Matrix (n_coord1, n_coord2)
pres	matflt_type (7.9.8.1.15)	Scalar pressure (including both thermal and fast particles) [J/m^3]. Related to the energy content, W, according to: pres=2*W/3. Time-dependent; Matrix (n_coord1, n_coord2)
pres_fast	matflt_type (7.9.8.1.15)	Scalar pressure of the fast particles [J/m^3]. Related to the fast particle energy content, Wf, according to: pres_fast=2*Wf/3. Time-dependent; Matrix (n_coord1, n_coord2)
pres_fast_pa	matflt_type (7.9.8.1.15)	Parallel pressure of the fast particles [J/m^3]. Related to the fast particle parallel energy content, Wfpar, according to: pres_fast_pa=2*Wfpar. Time-dependent; Matrix (n_coord1, n_coord2)
momentm_fast	matflt_type (7.9.8.1.15)	Kinetic toroidal angular momentum density of the fast ions [Ns/m^2]; Time-dependent; Matrix (n_coord1, n_coord2)
current	matflt_type (7.9.8.1.15)	Total toroidal driven current density (including electron and thermal ion back-current, or drag-current) [A/m^3]; Time-dependent; Matrix (n_coord1, n_coord2)
current_fast	matflt_type (7.9.8.1.15)	Toroidal current density of fast (non-thermal) particles of the distribution species (excluding electron and thermal ion back-current, or drag-current) [A.m^-2]; Time-dependent; Matrix (n_coord1, n_coord2).
torque_jrxb	matflt_type (7.9.8.1.15)	Toroidal torque density due to radial currents, excluding radial current due to neoclassical effect [N/m^2]; Time-dependent; Matrix (n_coord1, n_coord2)

Type of: dist_profile_values_2d:state (4285) I dist_profiles_2d:state (4289)

7.9.8.1.193 dist_thermalised_1d

Representation of the flux surface averaged source of thermal particles, momentum and energy due to thermalisation. Here thermalisation refers to non-thermal particles, sufficiently assimilated to the thermal background to be re-categorised as thermal particles. Note that this source may also be negative if thermal particles are being accelerated such that they form a distinct non-thermal contribution, e.g. due run-away of RF interactions.

member	type	description
particle	vecflt_type (7.9.8.1.18)	Source rate for the thermal particle density due to the thermalisation of fast (non-thermal) particles [1/s/m**3]; Time-dependedent; Vector (npsi)
momentum	vecflt_type (7.9.8.1.18)	Source rate for the toroidal angular momentum density within the thermal particle population due to the thermalisation of fast (non-thermal) particles [N/m**2]; Time-dependedent; Vector (npsi)
energy	vecflt_type (7.9.8.1.18)	Source rate for the energy density within the thermal particle population due to the thermalisation of fast (non-thermal) particles [W/m**3]; Time-dependedent; Vector (npsi)

Type of: dist_profiles_1d:thermalised (4287)

7.9.8.1.194 distri_vec

Vector over all distribution functions. Every distribution function has to be associated with only one particle species, specifiec in distri_vec/species/, but there could be multiple distribution function for each species. In this case, the fast particle populations should be superposed. Time-dependent. Structure array(ndistri_vec)

member	type	description
wave_id(:)	enum_instance (7.9.8.1.216)	List all waves affecting the distribution, as specified in waves/coherentwave/wave_id (see waves_types in the Documentation website under Conventions/Enumerated_datatypes). Vector(n_antennas)
source_id(:)	enum_instance (7.9.8.1.216)	List all neutral beam injectors and reactions contributing to the source, as specified in distsource/source/source_id (see distsource_types in the Documentation website under Conventions/Enumerated_datatypes). Vector(n_injectors_and_reactions)
species	species_reference (7.9.8.1.439)	Defines the distribution function species represented in this element of distri_vec. Time-dependent
gyro_type	integer (7.9.8.1.3)	Defines how to interpret the spatial coordinates: 1 = given at the actual particle position; 2 = given at the gyro centre of the particle position. Time-dependent
fast_filter	fast_thermal_separation_filter (7.9.8.1.228)	Description of how the fast and the thermal particle populations, used in global_param and profiles_1d, were separated.
global_param	dist_global_param (7.9.8.1.178)	Global parameters (in most cases volume integrated and surface averaged quanatities). Time-dependent
profiles_1d	dist_profiles_1d (7.9.8.1.184)	Flux surface averaged profiles.
profiles_2d	dist_profiles_2d (7.9.8.1.186)	2D profiles in the poloidal plane
dist_func	dist_func (7.9.8.1.174)	Distribution functions. The total distribution total distribution can either be given by the a set of markers/test particles (in markers), or by a gridded function (dist_expand). Note that the gridded distribution can be written as sum of successive approximations, where each term is given by an element in the vector dist_expand. Finally, the distribution can be written as a sum of a marker distribution and a gridded distribution, e.g. for delta-f Monte Carlo solution. Time-dependent
codeparam	codeparam (7.9.8.1.105)	Code parameters

Type of: distribution:distri_vec (4141)

7.9.8.1.195 distsource_global_param

Global parameters (volume integrated).

member	type	description
src_pow	exp0D (7.9.8.1.224)	Total power source [W]; Time-dependent.
src_rate	exp0D (7.9.8.1.224)	Particle source rate [1/s]; Time-dependent.
mag_axis	rz0D (7.9.8.1.386)	Position of the magnetic axis. Time-dependent; Scalar
toroid_field	b0r0 (7.9.8.1.82)	Characteristics of the vacuum toroidal field. Used to define the radial coordiante rho_tor. Time-dependent; Scalar

Type of: distsource_source:global_param (4302)

7.9.8.1.196 distsource_line_src_prof

1D profiles representation of a line source. Time-dependent

member	type	description
rho_tor	vecflt_type (7.9.8.1.18)	Toroidal flux coordinate at the grid points for 1D profiles [m]. Defined as sqrt(phi/pi/B0), where B0 = equilibrium/global_param/toroid_field/b0. Time-dependent; Vector (npsi)
rho_tor_norm	vecflt_type (7.9.8.1.18)	Normalised toroidal flux coordinate at the grid points for 1D profiles; Time-dependent; Vector (npsi)
psi	vecflt_type (7.9.8.1.18)	Poloidal flux at the grid points for 1D profiles [Wb], without 1/2pi and such that Bp = |grad psi| / (R 2 pi). Time-dependent; Vector (npsi)
R	vecflt_type (7.9.8.1.18)	Major radius at the line source. Time-dependent; Vector (npsi)
Z	vecflt_type (7.9.8.1.18)	Vertical position of the line source. Time-dependent; Vector (npsi)
theta	vecflt_type (7.9.8.1.18)	Polidal angle [rad]. Time-dependent; Vector (npsi)
theta_id	vecflt_type (7.9.8.1.18)	Type of poloidal angle: 1 : same as the poloidal angle in the equlibrium cpo; 2 : geometrical polar angle, tan(theta) = Z/(R-R_0); 3 : other. If option 3, a transformation to the geometrical poloidal angle is provided in th2th_pol.
th2th_pol	matflt_type (7.9.8.1.15)	Geometrical poloidal angle at grid points in theta, i.e. the transformation from theta to the polar poloidal angle; used only if angl_type=3; Time-dependent; Matrix (ndim1, ndim2)
pitch	vecflt_type (7.9.8.1.18)	Pitch (i.e. v_parallel/v) of source particles. Time-dependent; Vector (npsi)
energy	vecflt_type (7.9.8.1.18)	Kinetic energy of source particles [eV]. Time-dependent; Vector (npsi)
ang_momentum	vecflt_type (7.9.8.1.18)	Kinetic angular momentum of a single source particles, R m v_phi [Nms]. Time-dependent; Vector (npsi)
src_rate	vecflt_type (7.9.8.1.18)	Source density of particles [1/m^3/s]. Time-dependent; Vector (npsi)

Type of: distsource_source:line_srcprof (4302)

7.9.8.1.197 distsource_profiles_1d

1D radial profiles

member	type	description
rho_tor	vecflt_type (7.9.8.1.18)	Toroidal flux coordinate [m]. Defined as sqrt((phi-phi_axis)/pi/B0), where B0=../global_param/toroid_field/b0, phi is the toroidal flux and phi_axis is the toroidal flux at the magnetic axis. Time-dependent; Vector (npsi)
rho_tor_norm	vecflt_type (7.9.8.1.18)	The toroidal flux coordinate normalised to be zero at the axis and unity at the last closed flux surface, or last available fluxsurface if the last closed flux surface is not defined. Time-dependent; Vector (npsi)
psi	vecflt_type (7.9.8.1.18)	Poloidal flux [Wb], evaluated without 1/2pi and such that Bp=|grad psi| /R/2/pi. Time-dependent; Vector (npsi)
volume	vecflt_type (7.9.8.1.18)	Volume enclosed by the flux surface [m^3]. Time-dependent; Vector (npsi)
area	vecflt_type (7.9.8.1.18)	Cross-sectional area of the flux surface [m^2]. Time-dependent; Vector (npsi)
pow_den	exp1D (7.9.8.1.225)	Flux surface averaged power density [W/m^3]; Time-dependent; Vector (npsi)
trq_den	exp1D (7.9.8.1.225)	Flux surface averaged toroidal torque density [N/m^2]; Time-dependent; Vector (npsi)
src_rate	exp1D (7.9.8.1.225)	Flux surface averaged total source density of particles [m^-3 s^-1]; Time-dependent; Vector (npsi)

Type of: distsource_source:profiles_1d (4302)

7.9.8.1.198 distsource_profiles_2d

2D source profiles in terms of two phase space coordinates

member	type	description
grid_coord	vecint_type (7.9.8.1.19)	Identifies the coordinates specifies in dim1 and dim2. grid_coord(1) and grid_coord(2) describe the coordinate represented in dim1 and dim2. The possible coordinates are: 1=R, Major radius [m]; 2=Z, Vertical position [m]; 3=X, first cartesian coordinate in the horizontal plane [m]; 4=Y, second cartesian coordinate in the horizontal plane (grad(X) x grad(Y) = grad(Z)) [m]; 5=phi, toroidal angle [rad]; 6=psi, poloidal magnetic flux [T*m^2]; 7=rhotor, the square root of the toroidal flux; 8=theta, geometrical poloidal angle [rad]; 9=theta_b, Boozer poloidal angle [rad]; 10=vx, velocity in the x-direction [m/s]; 11=vy, velocity in the y-direction [m/s]; 12=vz, velocity in the z-direction [m/s]; 13=vel, total velocity [m/s]; 14=vphi, velocity in the phi-direction [m/s]; 15=vpar, velocity in the parallel direction [m/s]; 16=vperp, velocity in the perpendicular direction [m/s]; 17=E, Hamiltonian energy [J]; 18=Pphi, canonical toroidal angular momentum [kg m^2/s]; 19=mu, magnetic moment [J/T]; 20=Lambda=mu/E [1/T]. Vector (2)
dim1	matflt_type (7.9.8.1.15)	First coordinate of 2D grid. Time-dependent; Vector (ndim1,ndim2)
dim2	matflt_type (7.9.8.1.15)	Second coordinate of 2D grid. Time-dependent; Vector (ndim1,ndim2)
g11	matflt_type (7.9.8.1.15)	11 component of the covariant metric tensor in the (dim1, dim2) coordiante system. Time-dependent; Vector (ndim1,ndim2)
g12	matflt_type (7.9.8.1.15)	12 component of the covariant metric tensor in the (dim1, dim2) coordiante system. Time-dependent; Vector (ndim1,ndim2)
g21	matflt_type (7.9.8.1.15)	21 component of the covariant metric tensor in the (dim1, dim2) coordiante system. Time-dependent; Vector (ndim1,ndim2)

member	type	description
g22	matflt_type (7.9.8.1.15)	22 component of the covariant metric tensor in the (dim1, dim2) coordiante system. Time-dependent; Vector (ndim1,ndim2)
pow_den	exp2D (7.9.8.1.226)	Source power density. Here sum(M,N=1,2; pow_den*gNM*dimN*dimM) have unit [W]. Time-dependent; Vector (ndim1,ndim2)
src_rate	exp2D (7.9.8.1.226)	Source density of particles.Here sum(M,N=1,2; src_rate*gNM*dimN*dimM) have unit [1/s]. Time-dependent; Vector (ndim1,ndim2)

Type of: distsource_source:profiles_2d (4302)

7.9.8.1.199 distsource_source

Source

member	type	description
source_id(:)	enum_instance (7.9.8.1.216)	List of identifiers for the source, in term the type and name of the injectors and reactions that provide the source, along with an index separating sources with the same name and type. Possible content for type: NBI or reaction names (see distsource_types in the Documentation website under Conventions/Enumerated_datatypes); the field name should either be taken from nbi(*)%nbi_unit(*)%name, or describe the populations involved in the reaction, e.g. fast-thermal; the field index should separate different sources generated from a single injector or reaction. Vector(n_injectors_and_reactions)
species	species_reference (7.9.8.1.439)	Defines the source species represented in this element of the vector /distsource/source. Time-dependent
gyro_type	integer (7.9.8.1.3)	Defines how to interpret the spatial coordinates: 1 = given at the actual particle birth point; 2 =given at the gyro centre of the birth point.
global_param	distsource_global_param (7.9.8.1.195)	Global parameters.
profiles_1d	distsource_profiles_1d (7.9.8.1.197)	1D radial profiles
profiles_2d	distsource_profiles_2d (7.9.8.1.198)	2D source profiles in terms of two phase space coordinates
line_srcprof(:)	distsource_line_src_prof (7.9.8.1.196)	1D profiles representation of a line source. Time-dependent
source_rate	source_rate (7.9.8.1.433)	Source density of particles in phase space (real space, velocity space, spin state).
markers	weighted_markers (7.9.8.1.533)	Source given as a set of markers (test particles) born per second.
codeparam	codeparam (7.9.8.1.105)	Code parameters

Type of: distsource:source (4142)

7.9.8.1.200 divergence

Detailed information on beamlet divergence. Divergens is described as a super position of Gaussian profiles with amplitide "frac_divcomp" and vertical/horizontal divergence "div_vert"/"div_horiz". Note that for positive ion NBI the divergence is well described by a single Gaussian.

member	type	description
frac_divcomp	vecflt_type (7.9.8.1.18)	Fraction of injected particles. Vector(ndiv_comp)
div_vert	vecflt_type (7.9.8.1.18)	The vertical beamlet divergence [rad]. Here the divergence is defined for Gaussian beams as the angel where the beam density is reduced by a factor 1/e compared to the maximum density. For non-Gaussian beams the divergence is sqrt(2)*mean((x-mean(x))**2), where x is the angle and the mean should be performed over the beam density, P(x): mean(y)=int(y*P(x)*dx). Vector(ndiv_comp)
div_horiz	vecflt_type (7.9.8.1.18)	The horizontal beamlet divergence [rad]. Here the divergence is defined for Gaussian beams as the angel where the beam density is reduced by a factor 1/e compared to the maximum density. For non-Gaussian beams the divergence is sqrt(2)*mean((x-mean(x))**2), where x is the angle and the mean should be performed over the beam density, P(x): mean(y)=int(y*P(x)*dx). Vector(ndiv_comp)

Type of: beamletgroup:divergence (4190)

7.9.8.1.201 e_components

E-field representation in terms of the parallel and circularly polarised components

member	type	description
e_plus	complexgrid_scalar_cplx (7.9.8.1.116)	Left hand circularly polarised component of the perpendicular (to the static magnetic field) electric field [V/m]. Time-dependent; Complexgrid_scalar

member	type	description
e_minus	complexgrid_scalar_cplx (7.9.8.1.116)	Right hand circularly polarised component of the perpendicular (to the static magnetic field) electric field [V/m]. Time-dependent; Complexgrid_scalar
e_para	complexgrid_scalar_cplx (7.9.8.1.116)	Parallel (to the static magnetic field) component of electric field [V/m]. Time-dependent; Complexgrid_scalar
e_norm	complexgrid_scalar_cplx (7.9.8.1.116)	Magnitude of wave electric field normal to a flux surface [V/m]; Time-dependent; Complexgrid_scalar
e_binorm	complexgrid_scalar_cplx (7.9.8.1.116)	Magnitude of perpendicular (to the static magnetic field) wave electric field tangent to a flux surface [V/m]; Time-dependent; Complexgrid_scalar
b_norm	complexgrid_scalar_cplx (7.9.8.1.116)	Magnitude of perpendicular (to the static magnetic field) wave magnetic field normal to a flux surface [T]; Time-dependent; Complexgrid_scalar
b_binorm	complexgrid_scalar_cplx (7.9.8.1.116)	Magnitude of wave magnetic field tangent to a flux surface [T]; Time-dependent; Complexgrid_scalar
b_para	complexgrid_scalar_cplx (7.9.8.1.116)	Magnitude of wave magnetic field parallel to the equilibrium magnetic field [T]; Time-dependent; Complexgrid_scalar
k_perp	complexgrid_scalar_cplx (7.9.8.1.116)	Perpendicular wave number [1/m]; Time-dependent; Complexgrid_scalar

Type of: fullwave:e_components (4340)

7.9.8.1.202 ecemeasure

Measured values

member	type	description
harmonic	integer (7.9.8.1.3)	Harmonic detected by the ECE channels. Time-dependent.
position	rzphi1Dexp (7.9.8.1.394)	Position of the measurement. Time-dependent. Vector (nchannels)
te	exp1D (7.9.8.1.225)	Electron temperature [eV]. Time-dependent. Vector (nchannels)

Type of: ecediag:measure (4143)

7.9.8.1.203 ecesetup

diagnostic setup information

member	type	description
frequency	vecflt_type (7.9.8.1.18)	Frequency of the ECE channels. Vector (nchannels)
los	setup_line_exp (7.9.8.1.425)	Geometry of the line of sight.

Type of: ecediag:setup (4143)

7.9.8.1.204 edge_fluid

Fluid quantities

member	type	description
ne	edge_fluid_scalar_simplestruct (7.9.8.1.206)	Electron density [1/m^3]; Time-dependent;
ni(:)	edge_fluid_scalar (7.9.8.1.205)	Ion density [1/m^3] (per species). Array of structures(nspecies); Time-dependent;
ve	edge_fluid_vector_simplestruct (7.9.8.1.209)	Electron velocity [m/s]; Time-dependent;
vi(:)	edge_fluid_vector (7.9.8.1.208)	Ion velocity [m/s] (per species).Array of structures(nspecies); Time-dependent;
te	edge_fluid_scalar_simplestruct (7.9.8.1.206)	Electron temperature [eV]; Time-dependent;
ti(:)	edge_fluid_scalar (7.9.8.1.205)	Ion temperature [eV] (per species). Array of structures(nspecies).; Time-dependent;
te_aniso	edge_fluid_vector_simplestruct (7.9.8.1.209)	Anisotropic electron temperature [eV]; Time-dependent;
ti_aniso(:)	edge_fluid_vector (7.9.8.1.208)	Anisotropic ion temperature [eV] (per species). Array of structures(nspecies); Time-dependent;
po	edge_fluid_scalar_simplestruct (7.9.8.1.206)	Electric potential [V]; Time-dependent;
j	edge_fluid_vector_simplestruct (7.9.8.1.209)	Electric current [A]; Time-dependent;

member	type	description
b(:)	complexgrid_vector (7.9.8.1.121)	Magnetic field vector [T]; Time-dependent;

Type of: edge:fluid (4144)

7.9.8.1.205 edge_fluid_scalar

A scalar fluid quantity. To be used as array of structure

member	type	description
value(:)	complexgrid_scalar (7.9.8.1.115)	Value of the quantity. Possibly stored on multiple subgrids.; Time-dependent; Array of structures (nsubgrid_quantity)
bndvalue(:)	complexgrid_scalar (7.9.8.1.115)	Boundary values of the quantity. Possibly stored on multiple (boundary) subgrids.; Time-dependent; Array of structures (nsubgrid_quantity)
flux(:)	complexgrid_vector (7.9.8.1.121)	Flux of the quantity. Possibly stored on multiple subgrids.; Time-dependent; Array of structures (nsubgrid_quantity)
bndflux(:)	complexgrid_vector (7.9.8.1.121)	Flux of the quantity. Possibly stored on multiple (boundary) subgrids.; Time-dependent; Array of structures (nsubgrid_quantity)
transpcoeff(:)	edge_fluid_scalar_transpcoeff (7.9.8.1.207)	Transport coefficients; Time-dependent; Array of structures (nsubgrid_quantity)
source(:)	complexgrid_scalar (7.9.8.1.115)	Source; Time-dependent; Array of structures (nsubgrid_quantity)

Type of: edge_fluid:ni (4307) I edge_fluid:ti (4307) I edge_fluid_vector:comps (4311) I edge_fluid_vector_simplestruct:comps (4312)

7.9.8.1.206 edge_fluid_scalar_simplestruct

A scalar fluid quantity. To be used as simple structure.

member	type	description
value(:)	complexgrid_scalar (7.9.8.1.115)	Value of the quantity. Possibly stored on multiple subgrids.; Time-dependent; Array of structures (nsubgrid_quantity)
bndvalue(:)	complexgrid_scalar (7.9.8.1.115)	Boundary values of the quantity. Possibly stored on multiple (boundary) subgrids.; Time-dependent; Array of structures (nsubgrid_quantity)
flux(:)	complexgrid_vector (7.9.8.1.121)	Flux of the quantity. Possibly stored on multiple subgrids.; Time-dependent; Array of structures (nsubgrid_quantity)
bndflux(:)	complexgrid_vector (7.9.8.1.121)	Flux of the quantity. Possibly stored on multiple (boundary) subgrids.; Time-dependent; Array of structures (nsubgrid_quantity)
transpcoeff(:)	edge_fluid_scalar_transpcoeff (7.9.8.1.207)	Transport coefficients; Time-dependent; Array of structures (nsubgrid_quantity)
source(:)	complexgrid_scalar (7.9.8.1.115)	Source; Time-dependent; Array of structures (nsubgrid_quantity)

Type of: edge_fluid:ne (4307) I edge_fluid:po (4307) I edge_fluid:te (4307)

7.9.8.1.207 edge_fluid_scalar_transpcoeff

Transport coefficients; Time-dependent; Array of structures (nsubgrid_quantity)

member	type	description
d	complexgrid_vector_simplestruct (7.9.8.1.122)	Diffusivity [m^2/s]; Time-dependent;
v	complexgrid_vector_simplestruct (7.9.8.1.122)	Velocity [m/s]; Time-dependent;

Type of: edge_fluid_scalar:transpcoeff (4308) I edge_fluid_scalar_simplestruct:transpcoeff (4309)

7.9.8.1.208 edge_fluid_vector

A fluid vector quantity, with components possibly explicitly aligned to a coordinate direction. To be used as array of structure

member	type	description
griduid	integer (7.9.8.1.3)	Unique identifier of the grid this vector quantity is associated with.
basis	integer (7.9.8.1.3)	Index of basis (defined in associated grid) this vector is aligned to; If set to GRID_UNDEFINED=0, the canonical basis of the default coordinates of the grid assumed.
align	vecint_type (7.9.8.1.19)	Alignment of vector components, numerical flag. Int vector (number of vector components);
alignid	vecstring_type (7.9.8.1.20)	Alignment of vector components, string description. String vector (number of vector components);
comps(:)	edge_fluid_scalar (7.9.8.1.205)	Components of the vector. Array of structures (number of vector components); Time-dependent;

Type of: edge_fluid:ti_aniso (4307) I edge_fluid:vi (4307)

7.9.8.1.209 edge_fluid_vector_simplestruct

A fluid vector quantity, with components possibly explicitly aligned to a coordinate direction. To be used as simple structure.

member	type	description
griduid	integer (7.9.8.1.3)	Unique identifier of the grid this vector quantity is associated with.
basis	integer (7.9.8.1.3)	Index of basis (defined in associated grid) this vector is aligned to; If set to GRID_UNDEFINED=0, the canonical basis of the default coordinates of the grid assumed.
comps(:)	edge_fluid_scalar (7.9.8.1.205)	Components of the vector. Array of structures(ndim); Time-dependent;
align	vecint_type (7.9.8.1.19)	Alignment of vector components, numerical flag. Int vector(ndim);
alignid	vecstring_type (7.9.8.1.20)	Alignment of vector components, string description. String vector(ndim);

Type of: edge_fluid:j (4307) I edge_fluid:te_aniso (4307) I edge_fluid:ve (4307)

7.9.8.1.210 edge_kinetic

Kinetic quantities

member	type	description
f(:)	edge_kinetic_distribution (7.9.8.1.211)	Distribution function [1/m^3 (m/s)^-3]. Array of structuresr(nspecies); Time-dependent;

Type of: edge:kinetic (4144)

7.9.8.1.211 edge_kinetic_distribution

Distribution function [1/m^3 (m/s)^-3]. Array of structuresr(nspecies); Time-dependent;

member	type	description
value(:)	complexgrid_scalar (7.9.8.1.115)	Value of distribution function. Possibly stored on multiple subgrids.; Vector (nsubgrid_quantity). Time-dependent;
bndvalue(:)	complexgrid_scalar (7.9.8.1.115)	Boundary value of distribution function. Possibly stored on multiple subgrids.; Vector (nsubgrid_quantity). Time-dependent;
fluxes(:)	complexgrid_vector (7.9.8.1.121)	Fluxes in phase space. Possibly stored on multiple subgrids.; Vector (nsubgrid_quantity). Time-dependent;
source(:)	complexgrid_scalar (7.9.8.1.115)	Sources in phase space. Possibly stored on multiple subgrids.; Vector (nsubgrid_quantity). Time-dependent;

Type of: edge_kinetic:f (4313)

7.9.8.1.212 edges

Edges defining the coil volume faces. Structure array. Replicate this edge structure N-times for N-edge cross sections. Use just one for wire coil approximation.

member	type	description
edge_rzphi	rzphi1D (7.9.8.1.393)	Sequence of points describing a coil edge. Vector (npoints)

Type of: desc_coils:edges (4266)

7.9.8.1.213 edgespecies

Array of edge species.

member	type	description
nucindex	integer (7.9.8.1.3)	Index into list of nuclei; int
zmin	float (7.9.8.1.2)	Minimum Z of species charge state bundle
zmax	float (7.9.8.1.2)	Maximum Z of species charge state bundle
label	string (7.9.8.1.4)	String identifying the species (e.g. D0, D+, C0, C+, C+2, ...)

Type of: compositions_type:edgespecies (4230)

7.9.8.1.214 element_desc

Element description (equivalent to wall/compositions/nuclei, can link there using nucindex).

member	type	description
nucindex	integer (7.9.8.1.3)	Index into list of nuclei in wall/compositions/nuclei if the element is present there. Otherwise it is 0 and zn, amn and label have to be set.
label	string (7.9.8.1.4)	Element name/label
zn	float (7.9.8.1.2)	Nuclear charge [units of elementary charge];
amn	float (7.9.8.1.2)	Mass of atom [amu]

Type of: wall:elements (4176)

7.9.8.1.215 entry_def

Structure defining a database entry

member	type	description
user	string (7.9.8.1.4)	Name of the user if private data. Value should be ITM if stored in the official common ITM tree
machine	string (7.9.8.1.4)	Name of the device
shot	integer (7.9.8.1.3)	Shot number
run	integer (7.9.8.1.3)	Run number

Type of: mdinfo:md_entry (4393)

7.9.8.1.216 enum_instance

Specifies a specific enumerated instance of an object or process in term of its type, name and an index. E.g. the input could be the wave with index=2, selected from all waves launched by the antenna with name=A2, where the antenna is of type=IC.

member	type	description
type	identifier (7.9.8.1.263)	Identify the type of the object or process.
name	string (7.9.8.1.4)	The name of the object or process. Here the object should be an instans of the type specified in the field type.
index	integer (7.9.8.1.3)	Index the separating objects or processes with the same name.

Type of: coherentwave:wave_id (4210) I distri_vec:source_id (4297) I distri_vec:wave_id (4297) I distsource_source:source_id (4302)

7.9.8.1.217 eqconstraint

measurements to constrain the equilibrium, output values and accuracy of the fit

member	type	description
bpol	eqmes1D (7.9.8.1.220)	poloidal pickup coils [T]
bvac_r	eqmes0D (7.9.8.1.219)	Vacuum field times radius in the toroidal field magnet [T.m];
diamagflux	eqmes0D (7.9.8.1.219)	Diamagnetic flux [Wb], defined as integral (Btor - Btor,vac) dS where the integral is over the poloidal cross section of the plasma. It is measured by a single wire loop around the cross section of the torus (e.g. Wesson, Tokamaks, 1997, p.473). It gives information about the separation of the two source profiles p' and FF' of the Grad-Shafranov equation.
faraday	eqmes1D (7.9.8.1.220)	Faraday rotation angles [rad]
flux	eqmes1D (7.9.8.1.220)	Poloidal flux loops [Wb]
i_plasma	eqmes0D (7.9.8.1.219)	Plasma current [A];
isoflux	isoflux (7.9.8.1.269)	Point series at which the flux is considered the same
jsurf	eqmes1D (7.9.8.1.220)	Average of current density on the flux surface [A/m^2]
magnet_iron	magnet_iron (7.9.8.1.287)	Magnetisation in iron segments [T]
mse	eqmes1D (7.9.8.1.220)	MSE angles [rad]
ne	eqmes1D (7.9.8.1.220)	Electron density [m^-3 for local measurement, m^-2 if line integrated]
pfcurrent	eqmes1D (7.9.8.1.220)	Current in poloidal field coils [A]
pressure	eqmes1D (7.9.8.1.220)	Total pressure [Pa]
q	q (7.9.8.1.371)	Safety factor
xpts	xpts (7.9.8.1.536)	Position of the X-point(s)

Type of: equilibrium:eqconstraint (4146)

7.9.8.1.218 eqgeometry

Geometry of the plasma boundary

member	type	description
source	string (7.9.8.1.4)	Comment describing the origin of the eqgeometry data; String
boundarytype	integer (7.9.8.1.3)	0 (limiter) or 1 (separatrix); Integer; Time-dependent
boundary(:)	rz1Dexp (7.9.8.1.389)	RZ description of the plasma boundary; This is formally declared as an array of structure to allow for time-dependent size of the R and Z vectors in the sub-structure below. However, boundary must be allocated to size 1. Time-dependent;
geom_axis	rz0D (7.9.8.1.386)	RZ position of the geometric axis (defined as (Rmin+Rmax) / 2 and (Zmin+Zmax) / 2 of the boundary) [m]; Time-dependent; Scalar
a_minor	float (7.9.8.1.2)	Minor radius of the plasma boundary [m]; Time-dependent; Scalar
elongation	float (7.9.8.1.2)	Elongation of the plasma boundary; Time-dependent; Scalar
elong_upper	float (7.9.8.1.2)	Elongation upper of the plasma boundary; Time-dependent; Scalar
elong_lower	float (7.9.8.1.2)	Elongation lower of the plasma boundary; Time-dependent; Scalar
tria_upper	float (7.9.8.1.2)	Upper triangularity of the plasma boundary; Time-dependent; Scalar
tria_lower	float (7.9.8.1.2)	Lower triangularity of the plasma boundary; Time-dependent; Scalar
xpts(:)	rz1Dexp (7.9.8.1.389)	Position of the Xpoints, first is the active xpoint if diverted [m]; This is formally declared as an array of structure to allow for time-dependent size of the R and Z vectors in the sub-structure below. However, xpts must be allocated to size 1. Time-dependent;
left_low_st	rz0D (7.9.8.1.386)	Position of the lower left strike point [m]; Time-dependent; Scalar
right_low_st	rz0D (7.9.8.1.386)	Position of the lower right strike point [m]; Time-dependent; Scalar
left_up_st	rz0D (7.9.8.1.386)	Position of the upper left strike point [m]; Time-dependent; Scalar
right_up_st	rz0D (7.9.8.1.386)	Position of the upper right strike point [m]; Time-dependent; Scalar
active_limit	rz0D (7.9.8.1.386)	Position of the active limiter point (point of the plasma boundary in contact with the limiter) [m]; Set R = 0 for X-point plasma; Time-dependent; Scalar
ang_lcms_upo	float (7.9.8.1.2)	Angle at the LMCS X point upper outer; Time-dependent; Scalar
ang_lcms_upi	float (7.9.8.1.2)	Angle at the LMCS X point upper inner; Time-dependent; Scalar
ang_lcms_lwo	float (7.9.8.1.2)	Angle at the LMCS X point lower outer; Time-dependent; Scalar
ang_lcms_lwi	float (7.9.8.1.2)	Angle at the LMCS X point lower inner; Time-dependent; Scalar

Type of: equilibrium:eqgeometry (4146) I scenario:eqgeometry (4169)

7.9.8.1.219 eqmes0D

Structure for equilibrium measurement 0D signal

member	type	description
measured	float (7.9.8.1.2)	Measured value of the signal; Time-dependent; Scalar.

member	type	description
source	string (7.9.8.1.4)	Path to the source signal (diagnostic or genprof, from which to read all info on the signal); String
time	float (7.9.8.1.2)	Time (exact time slice used from the time array of the source signal. If the time slice does not exist in the time array of the source signal, it means linear interpolation has been used); Time-dependent; Scalar.
exact	integer (7.9.8.1.3)	1 means exact data, is not fitted; 0 means the equilibrium code does a least square fit; scalar integer
weight	float (7.9.8.1.2)	weight given to the measurement (¿= 0); Time-dependent; Scalar.
sigma	float (7.9.8.1.2)	standard deviation of the measurement; Time-dependent; Scalar.
calculated	float (7.9.8.1.2)	Signal as recalculated by the equilibrium code; Time-dependent; Scalar.
chi2	float (7.9.8.1.2)	chi^2 of (calculated-measured); Time-dependent; Scalar.

Type of: eqconstraint:bvac_r (4320) I eqconstraint:diamagflux (4320) I eqconstraint:i_plasma (4320)

7.9.8.1.220 eqmes1D

Structure for equilibrium measurement 1D signal

member	type	description
measured	vecflt_type (7.9.8.1.18)	Measured value of the signal; Time-dependent; Array(nmeas)
source	string (7.9.8.1.4)	Path to the source signal (diagnostic or genprof, from which to read all info on the signal), e.g. 'magdiag/bpol_probes/measure/value'. String
time	float (7.9.8.1.2)	Exact time slice used from the time array of the source signal. If the time slice does not exist in the time array of the source signal, it means linear interpolation has been used);Time-dependent; Scalar
exact	vecint_type (7.9.8.1.19)	1 means exact data, is not fitted; 0 means the equilibrium code does a least square fit; Time-dependent; Array(nmeas)
weight	vecflt_type (7.9.8.1.18)	weight given to the measurement (¿= 0); Time-dependent; Array(nmeas)
sigma	vecflt_type (7.9.8.1.18)	standard deviation of the measurement; Time-dependent; Array(nmeas)
calculated	vecflt_type (7.9.8.1.18)	Signal as recalculated by the equilibrium code; Time-dependent; Array(nmeas)
chi2	vecflt_type (7.9.8.1.18)	chi^2 of (calculated-measured); Time-dependent; Array(nmeas)

Type of: eqconstraint:bpol (4320) I eqconstraint:faraday (4320) I eqconstraint:flux (4320) I eqconstraint:jsurf (4320) I eqconstraint:mse (4320) I eqconstraint:ne (4320) I eqconstraint:pfcurrent (4320) I eqconstraint:pressure (4320) I magnet_iron:mr (4390) I magnet_iron:mz (4390)

7.9.8.1.221 equatorial_plane

Description of the equitorial plane or any other omnigeuous surfaces. Time-dependent

member	type	description
r	vecflt_type (7.9.8.1.18)	Major radius coordinate of the equitorial plane (m). Time-dependent; Vector(n_equitorial_grid)
z	vecflt_type (7.9.8.1.18)	Major radius coordinate of the equitorial plane (m). Time-dependent; Vector(n_equitorial_grid)
s	vecflt_type (7.9.8.1.18)	Distance along the poloidal projection of the equitorial plane (m). Here s=0 should be at the magnetic axis, s>0 on the low field side and s<0 on the high field side. For example, in up-down symmetric fields s=R-R0, where R is the major radius and R0 the major radius at the magnetic axis. Time-dependent; Vector(n_equatorial_grid)
rho_tor	vecflt_type (7.9.8.1.18)	Toroidal flux coordinate [m]. Defined as sqrt((phi-phi_axis)/pi/B0), where B0 is the reference magnetic field, phi is the toroidal flux and phi_axis is the toroidal flux at the magnetic axis. Time-dependent; Vector (n_equitorial_grid)
psi	vecflt_type (7.9.8.1.18)	Poloidal flux [Wb], evaluated without 1/2pi and such that Bp=|grad psi| /R/2/pi. Time-dependent; Vector (n_equitorial_grid)
b_mod	vecflt_type (7.9.8.1.18)	The modulous of the magnetic field along the equitorial plane, or more generally of the omnigeuous surfaces [T]. Time-dependent; Vector (n_equatorial_grid)

Type of: dist_distrivec_distfunc_fexp_param:equatorial (4275) I parameters:equatorial (4442)

7.9.8.1.222 equilibrium_profiles2d_grid

definition of the 2D grid

member	type	description
dim1	vecflt_type (7.9.8.1.18)	First dimension values; Time-dependent; Vector (ndim1)
dim2	vecflt_type (7.9.8.1.18)	Second dimension values; Time-dependent; Vector (ndim2)

member	type	description
connect	matint_type (7.9.8.1.16)	In case of a finite elemnt representation, lists the points (3 for triangles, 4 for quadrangles) which define a finite element. In this case, ndim1=ndim2 and the value of grid_connect represents the index of the points in the list 1:ndim. E.g. : grid_connect(i,1:4) is a list of four integers [k1 k2 k3 k4] meaning that finite element #i is defined by the points (dim1(k1),dim2(k1)),(dim1(k2),dim2(k2)),(dim1(k3),dim2(k3)) and (dim1(k4),dim2(k4)); Time-dependent; Matrix of integers (nelement,4)

Type of: equilibrium_profiles_2d:grid (4326)

7.9.8.1.223 equilibrium_profiles_2d

output profiles in the poloidal plane

member	type	description
grid_type	vecstring_type (7.9.8.1.20)	Selection of one of a set of grid types. 1-rectangular (R,Z) grid, in this case the position arrays should not be filled since they are redundant with grid/dim1 and dim2.
grid	equilibrium_profiles2d_grid (7.9.8.1.222)	definition of the 2D grid
r	matflt_type (7.9.8.1.15)	values of the major radius on the grid [m]; Time-dependent; Matrix (ndim1, ndim2)
z	matflt_type (7.9.8.1.15)	values of the altitude on the grid [m]; Time-dependent; Matrix (ndim1, ndim2)
psi	matflt_type (7.9.8.1.15)	values of the poloidal flux at the grid in the poloidal plane [Wb]; Time-dependent; Matrix (ndim1, ndim2)
theta	matflt_type (7.9.8.1.15)	values of the poloidal angle on the grid [rad]; Time-dependent; Matrix (ndim1, ndim2)
phi	matflt_type (7.9.8.1.15)	Toroidal flux [Wb]. Time-dependent; Matrix (ndim1, ndim2)
jphi	matflt_type (7.9.8.1.15)	toroidal plasma current density [A m-2]; Time-dependent; Matrix (ndim1, ndim2)
jpar	matflt_type (7.9.8.1.15)	parallel (to magnetic field) plasma current density [A m-2]; Time-dependent; Matrix (ndim1, ndim2)
br	matflt_type (7.9.8.1.15)	R component of the poloidal magnetic field at the specified grid [T]; Time-dependent; Matrix (ndim1, ndim2)
bz	matflt_type (7.9.8.1.15)	Z component of the poloidal magnetic field at the specified grid [T]; Time-dependent; Matrix (ndim1, ndim2)
bphi	matflt_type (7.9.8.1.15)	toroidal component of the magnetic field at the specified grid [T]; Time-dependent; Matrix (ndim1, ndim2)
vphi	matflt_type (7.9.8.1.15)	toroidal flow velocity [m/s]; Time-dependent; Matrix (ndim1, ndim2)
vtheta	matflt_type (7.9.8.1.15)	Poloidal flow velocity [m/s]; Time-dependent; Matrix (ndim1, ndim2)
rho_mass	matflt_type (7.9.8.1.15)	Mass density [kg/m^3]; Time-dependent; Matrix (ndim1, ndim2)
pressure	matflt_type (7.9.8.1.15)	Pressure [Pa]; Time-dependent; Matrix (ndim1, ndim2)
temperature	matflt_type (7.9.8.1.15)	Temperature [eV]; Time-dependent; Matrix (ndim1, ndim2)

Type of: equilibrium:profiles_2d (4146)

7.9.8.1.224 exp0D

Structure for experimental time-dependent scalar signal

member	type	description
value	float (7.9.8.1.2)	Signal value; Time-dependent; Scalar
abserror	float (7.9.8.1.2)	Absolute error on signal; Time-dependent; Scalar
relerror	float (7.9.8.1.2)	Relative error on signal (normalised to signal value); Time-dependent; Scalar

Type of: antenna_ec:power (4180) I antenna_ic:frequency (4181) I antenna_ic:power (4181) I antenna_lh:power (4182) I bolometer_processed:prad_core (4194) I bolometer_processed:prad_tot (4194) I distsource_global_param:src_pow (4298) I distsource_global_param:src_rate (4298) I fusiondiag_ct_chords:energy (4348) I fusiondiag_spec1d:energy (4354) I fusiondiag_spec2d:energy (4355) I magdiag:diamagener (4155) I magdiag:diamagflux (4155) I magdiag:ip (4155) I nbi_unit:inj_eng_unit (4417) I nbi_unit:pow_unit (4417) I solcurdiag_sol_current:measure (4532) I straps:current (4547) I straps:phase (4547) I toroidfield:bvac_r (4173) I toroidfield:current (4173)

7.9.8.1.225 exp1D

Structure for experimental 1D signal

member	type	description
value	vecflt_type (7.9.8.1.18)	Signal value; Time-dependent; Vector

member	type	description
abserror	vecflt_type (7.9.8.1.18)	Absolute error on signal; Time-dependent; Vector
relerror	vecflt_type (7.9.8.1.18)	Relative error on signal (normalised to signal value); Time-dependent; Vector

Type of: distsource_profiles_2d:pow_den (4301) I distsource_profiles_2d:src_rate (4301) I fusiondiag_emissivity2d:r (4352) I fusiondiag_emissivity2d:z (4352) I fusiondiag_spec2d:measure (4355)

7.9.8.1.227 f_expansion

Distribution function, f, expanded into a vector of successive approximations. The first element in the vector (f_expansion(1)) is the zeroth order distribution function, while the K:th element in the vector (f_expansion(K)) is the K:th correction, such that the total distribution function is a sum over all elements in the f_expansion vector. Time-dependent. Structure array(Nf_expansion)

member	type	description
grid	complexgrid (7.9.8.1.110)	Grid for storing the distribution function. Time-dependent; Complexgrid
values	complexgrid_scalar (7.9.8.1.115)	Values of the distribution function [m^-3 (m/s)^-3]. Time-dependent; Complexgrid_scalar.
parameters	dist_distrivec_distfunc_fexp_param (7.9.8.1.172)	Parameters used to defined the grid coordinates. Time-dependent

Type of: dist_func:f_expansion (4277)

7.9.8.1.228 fast_thermal_separation_filter

Description of how the fast and the thermal particle populations were separated.

member	type	description
method	identifier (7.9.8.1.263)	Identifier describing the method used to separate the fast and thermal particle population (see fast_thermal_separation_filter_identifier_definition in the Documentation website under Conventions/Enumerated_datatypes)
energy_sep	vecflt_type (7.9.8.1.18)	Energy at which the fast and thermal particle populations were separated [eV]. Vector (nrho). Time-dependent.

Type of: corefast_values:filter (4237) I distri_vec:fast_filter (4297)

7.9.8.1.229 filter

Laplace proper filter

member	type	description
num	matflt_type (7.9.8.1.15)	Coefficients of the numerator, in increasing order : a0 + a1*s + ... + an*s^n; Matrix (nsupplies,n)
den	matflt_type (7.9.8.1.15)	Coefficients of the denominator, in increasing order : b0 + b1*s + ... + bm*s^m; Matrix (nsupplies,m)

Type of: desc_supply:filter (4270)

7.9.8.1.230 flat_polygon

Polygon lying on a flat surface on a 3D cartesian space (x,y,z). The coordinate system on the surface is defined by the origin, "origin", and two basis vectors in (x,y,z) space, "basis1" and "basis2". The polyon is then represented as the origin, plus a linear combination of the two basis vectors using coord1 and coord2, i.e. the j:th point is described by "origin+basis1*coord1(j)+basis2*coord2(j)". As an example, a rectangle centered at the origin, with two of the corners given by "origin+basis1" and "origin+basis2" can be described using coord1=[1,0,-1,0] and coord2=[0,1,0,-1]. The normal vector of the surface is defined to be in the direction "basis1 x basis2".

member	type	description
origin	xyz0D (7.9.8.1.537)	Origin of the surface coordinate system.
basis1	xyz0D (7.9.8.1.537)	First basis vector on the surface.
basis2	xyz0D (7.9.8.1.537)	First basis vector on the surface.
coord1	vecflt_type (7.9.8.1.18)	First coordinate of the polygon points, conjugate to basis1.
coord2	vecflt_type (7.9.8.1.18)	Second coordinate of the polygon points, conjugate to basis2.

Type of: nbi_nbi_unit_wall:collimator (4415)

7.9.8.1.231 flush

FLUSH package coefficients for the mapping of the equlibrium. The time grid of this structure is the same as the equilibrium structure above.

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
position	rz1D (7.9.8.1.387)	Major radius and altitude of the FLUSH grid [m]; Time-dependent; Vectors resp. (nR) and (nZ)
coef	matflt_type (7.9.8.1.15)	Coefficients of the fit; Time-dependent; Matrix 2D (nR,nZ)
codeparam	codeparam (7.9.8.1.105)	Code parameters

Type of: equilibrium:flush (4146)

7.9.8.1.232 flux_loops

Poloidal flux loops RZ coordinates have 1 component for the full loop and two if there is a negative reference loop

member	type	description
setup_floops	setup_floops (7.9.8.1.423)	diagnostic setup information
measure	exp1D (7.9.8.1.225)	Measured flux [Wb]; Time-dependent; Vector (nloops)

Type of: magdiag:flux_loops (4155)

7.9.8.1.233 fluxel

Structure for the fluxes of a field of the core transport equations (electrons); Time-dependent;

member	type	description
flux_dv	vecflt_type (7.9.8.1.18)	Flux of the field calculated from the transport coefficients. Time-dependent; Vector (nrho)
flux_interp	vecflt_type (7.9.8.1.18)	Interpretative flux deduced from measured data, the integral of the source term, and the time derivative of the field. Time-dependent; Vector (nrho)

Type of: corefield:flux (4238)

7.9.8.1.234 fluximp

Structure for the fluxes of a field of the core transport equations (impurities); Time-dependent;

member	type	description
flux_dv	matflt_type (7.9.8.1.15)	Flux of the field calculated from the transport coefficients. Time-dependent; Array2D (nrho,nzimp)
flux_interp	matflt_type (7.9.8.1.15)	Interpretative flux deduced from measured data, the integral of the source term, and the time derivative of the field. Time-dependent; Array2D (nrho,nzimp)

Type of: impurity_type:flux (4369)

7.9.8.1.235 fluxion

Structure for the fluxes of a field of the core transport equations (ions); Time-dependent;

member	type	description
flux_dv	matflt_type (7.9.8.1.15)	Flux of the field calculated from the transport coefficients. Time-dependent; Matrix (nrho,nion)
flux_interp	matflt_type (7.9.8.1.15)	Interpretative flux deduced from measured data, the integral of the source term, and the time derivative of the field. Time-dependent; Matrix (nrho,nion)

Type of: corefieldion:flux (4239)

7.9.8.1.236 focussing

Describes how the beam is focussed.

member	type	description
focal_len_hz	float (7.9.8.1.2)	Horizontal focal length along the beam line, i.e. the point along the centre of the beamlet-group where the beamlet-group has its minimum horizontal width [m]. Scalar
focal_len_vc	float (7.9.8.1.2)	Vertical focal length along the beam line, i.e. the point along the centre of the beamlet-group where the beamlet-group has its minimum vertical width [m]. Scalar
width_min_hz	float (7.9.8.1.2)	The horizontal width of the beamlet-group at the at the horizontal focal point [m]. Scalar
width_min_vc	float (7.9.8.1.2)	The vertical width of the beamlet-group at the at the vertical focal point [m]. Scalar

Type of: beamletgroup:focussing (4190)

7.9.8.1.237 fullwave

Solution by full wave code

member	type	description
grid	complexgrid (7.9.8.1.110)	Grid for storing the components of the wave field; Time-dependent
e_components	e_components (7.9.8.1.201)	E-field representation in terms of the parallel and circularly polarised components
pol_decomp	pol_decomp (7.9.8.1.361)	TO BE REMOVED, being replaced by e_components and grid. Kept only to make smooth transition between data-type versions. [Poloidal decomposition of the wave fields. Uses the flux surface grid in grid_1d.]
local	local (7.9.8.1.285)	TO BE REMOVED, being replaced by e_components and grid. Kept only to make smooth transition between data-type versions. [Local description of the wave fields. Uses the grid in grid_2d].

Type of: coherentwave:fullwave (4210)

7.9.8.1.238 fusiondiag_colli_3d

Geometry of each channel of detector for arbitrary cross section. Replicate this structure for each channel.

member	type	description
name	string (7.9.8.1.4)	Name tag for the chord. String.
voxels(:)	fusiondiag_voxels (7.9.8.1.253)	Array of voxel structures defining the plasma region viewed from each collimator and scaling factor for effective solid angle for sources.

Type of: fusiondiag_collimator:colli_3d (4344)

7.9.8.1.239 fusiondiag_colli_circ

Geometry of each channel of detector for circular cross section. Replicate this structure for each channel.

member	type	description
name	string (7.9.8.1.4)	Name tag for the chord.
setup_line	setup_line (7.9.8.1.424)	Geometric description of the line of sight. First pivot close to detector position and second pivot at first wall hit.
colliunit(:)	fusiondiag_colliunit_circ (7.9.8.1.242)	Detail of each collimator unit of each chord. Replicate this structure for each collimator.

Type of: fusiondiag_collimator:colli_circ (4344)

7.9.8.1.240 fusiondiag_colli_poly

Geometry of each channel of detector for polygon cross section. Replicate this structure for each channel.

member	type	description
name	string (7.9.8.1.4)	Name tag for the chord.
setup_line	setup_line (7.9.8.1.424)	Geometric description of the line of sight. First pivot close to detector position and second pivot at first wall hit.
colliunit(:)	fusiondiag_colliunit_poly (7.9.8.1.243)	Detail of each collimator unit of each chord. Replicate this structure for each collimator.

Type of: fusiondiag_collimator:colli_poly (4344)

7.9.8.1.241 fusiondiag_collimator

Collimator array.

member	type	description
colli_circ(:)	fusiondiag_colli_circ (7.9.8.1.239)	Geometry of each channel of detector for circular cross section. Replicate this structure for each channel.
colli_poly(:)	fusiondiag_colli_poly (7.9.8.1.240)	Geometry of each channel of detector for polygon cross section. Replicate this structure for each channel.
colli_3d(:)	fusiondiag_colli_3d (7.9.8.1.238)	Geometry of each channel of detector for arbitrary cross section. Replicate this structure for each channel.

Type of: fusiondiag_fus_product:collimator (4353)

7.9.8.1.242 fusiondiag_colliunit_circ

Detail of each collimator unit of each chord. Replicate this structure for each collimator.

member	type	description
radius	vecflt_type (7.9.8.1.18)	Radius of cross section; Typically dim=2 for just entry and exit of collimator; Vector (dim)
centre	rzphi1D (7.9.8.1.393)	Position of cross section centre; Typically dim=2 for just entry and exit of collimator; Vector (dim)

Type of: fusiondiag_colli_circ:colliunit (4342)

7.9.8.1.243 fusiondiag_colliunit_poly

Detail of each collimator unit of each chord. Replicate this structure for each collimator.

member	type	description
dimension	float (7.9.8.1.2)	Number of edges of cross section.
nodes	rzphi2D (7.9.8.1.396)	Coordinates of nodes defining each cross section; Typically dim=2 for just entry and exit of collimator; Vector (dim,nnodes)

Type of: fusiondiag_colli_poly:colliunit (4343)

7.9.8.1.244 fusiondiag_counts

Integrated emissivity [s^-1].

member	type	description
units	string (7.9.8.1.4)	Energy units (ev, tof - time of flight)
ct_chords(:)	fusiondiag_ct_chords (7.9.8.1.245)	Integrated emissivity for all spatial chords. Replicate the structure for each energy bin [s^-1]. Time-dependent
ct_energy(:)	fusiondiag_ct_energy (7.9.8.1.246)	Integrated emissivity for each chord as function of energy like variable. Replicate this structure for each chord [s^-1]. Time-dependent
detect_ct(:)	fusiondiag_detect_ct_energy (7.9.8.1.247)	Detected integrated emissivity for each chord as function of energy like variable. Replicate this structure for each chord. This structure contains the actual experimental data as obtained from the detector. To get from species emissivity to the detector counts a detector tranfer matrix is used (should be shot independent) since a monoenergetic beam will ultimately show up with a given spread in the detector channels. Each detector type or l.o.s. might have a dedicated detctor transfer matrix since the energy discrimination can vary. [s^-1]. Time-dependent

Type of: fusiondiag_fus_product:counts (4353)

7.9.8.1.245 fusiondiag_ct_chords

Integrated emissivity for all spatial chords. Replicate the structure for each energy bin [s^-1].

member	type	description
name	vecstring_type (7.9.8.1.20)	Name tag for each chord. Vector (nchords)
energy	exp0D (7.9.8.1.224)	Energy like variable span. Use mininum energy when no energy spectra is resolved.
measure	exp1D (7.9.8.1.225)	Measured counts. Vector (nchords)

Type of: fusiondiag_counts:ct_chords (4347)

7.9.8.1.246 fusiondiag_ct_energy

Integrated emissivity for each chord as function of energy like variable. Replicate this structure for each chord [s^-1].

member	type	description
energy	exp1D (7.9.8.1.225)	Energy array of detected counts spectra. Vector (nenergy)
measure	exp1D (7.9.8.1.225)	Measured counts spectra. Vector (nenergy)

Type of: fusiondiag_counts:ct_energy (4347)

7.9.8.1.247 fusiondiag_detect_ct_energy

Detected integrated emissivity for each chord as function of energy like variable. Replicate this structure for each chord. This structure contains the actual experimental data as obtained from the detector. To get from species emissivity to the detector counts a detector tranfer matrix is used (should be shot independent) since a monoenergetic beam will ultimately show up with a given spread in the detector channels. Each detector type or l.o.s. might have a dedicated detctor transfer matrix since the energy discrimination can vary. [s^-1].

member	type	description
energy	exp1D (7.9.8.1.225)	Energy array of detected counts spectra. Vector (nenergy)
measure	exp1D (7.9.8.1.225)	Measured counts spectra. Vector (nenergy)
diag_func	diag_func (7.9.8.1.168)	Structure to provide the description on the detctor used and store the transfer matrix of the detector for that l.o.s.

Type of: fusiondiag_counts:detect_ct (4347)

7.9.8.1.248 fusiondiag_emissivity1d

Reconstructed 1D emissivity [counts.m^-3.s-1].

member	type	description
units	string (7.9.8.1.4)	Energy units (ev, tof - time of flight)
r	exp1D (7.9.8.1.225)	horizontal grid. Vector (dim)

member	type	description
z	exp1D (7.9.8.1.225)	vertical grid. Vector (dim)
spec1d(:)	fusiondiag_spec1d (7.9.8.1.251)	Emissivity in given energy like variable range [counts.m^-3.s-1]; Time-dependent

Type of: fusiondiag_fus_product:emissivity1d (4353)

7.9.8.1.249 fusiondiag_emissivity2d

Reconstructed 2D emissivity [counts.m^-3.s-1].

member	type	description
units	string (7.9.8.1.4)	Energy units (ev, tof - time of flight)
r	exp2D (7.9.8.1.226)	radial grid. Vector (dim1,dim2)
z	exp2D (7.9.8.1.226)	vertical grid. Vector (dim1,dim2)
spec2d(:)	fusiondiag_spec2d (7.9.8.1.252)	Emissivity in given energy like variable range [counts.m^-3.s-1]; Time-dependent

Type of: fusiondiag_fus_product:emissivity2d (4353)

7.9.8.1.250 fusiondiag_fus_product

Source. Time-dependent. Structure array. Replicate this source structure to accommodate neutron and gammas.

member	type	description
product	string (7.9.8.1.4)	Type of fusion product (neutron,gamma)
reaction	string (7.9.8.1.4)	Type of reaction involved (e.g. DD neutron, Be-alpha,n,gamma-C)
collimator	fusiondiag_collimator (7.9.8.1.241)	Collimator array.
counts	fusiondiag_counts (7.9.8.1.244)	Integrated emissivity [s^-1].
emissivity1d	fusiondiag_emissivity1d (7.9.8.1.248)	Reconstructed 1D emissivity [counts.m^-3.s-1].
emissivity2d	fusiondiag_emissivity2d (7.9.8.1.249)	Reconstructed 2D emissivity [counts.m^-3.s-1].
codeparam	codeparam (7.9.8.1.105)	Code parameters

Type of: fusiondiag:fus_product (4147)

7.9.8.1.251 fusiondiag_spec1d

Emissivity in given energy like variable range [counts.m^-3.s-1].

member	type	description
energy	exp0D (7.9.8.1.224)	Energy like variable span. Use mininum energy when no energy spectra is resolved. Scalar
measure	exp1D (7.9.8.1.225)	reconstruction. Vector (dim)

Type of: fusiondiag_emissivity1d:spec1d (4351)

7.9.8.1.252 fusiondiag_spec2d

Emissivity in given energy like variable range [counts.m^-3.s-1].

member	type	description
energy	exp0D (7.9.8.1.224)	Energy like variable span. Use mininum energy when no energy spectra is resolved. Scalar
measure	exp2D (7.9.8.1.226)	reconstruction. Vector (dim1,dim2)

Type of: fusiondiag_emissivity2d:spec2d (4352)

7.9.8.1.253 fusiondiag_voxels

Array of voxel structures defining the plasma region viewed from each collimator and scaling factor for effective solid angle for sources.

member	type	description
centre	rzphi0D (7.9.8.1.392)	Centre of voxel; used also as origin of direction to detector
direction	rzphi0D (7.9.8.1.392)	Second point defining the direction to detector.
volume	float (7.9.8.1.2)	Voxel Volume
solid_angle	float (7.9.8.1.2)	effective solid angle (divided by 4pi) of the voxel towards detector.

Type of: fusiondiag_colli_3d:voxels (4341)

7.9.8.1.254 geom

Geometry between components

member	type	description
dr_bb_sh_ib	float (7.9.8.1.2)	Gap between the breeding blanket module and the shield (inboard) in the equatorial section [m]; Scalar
dr_sh_vv_ib	float (7.9.8.1.2)	Gap between the shield and the vacuum vessel (inboard) in the equatorial section [m]; Scalar
dr_bb_sh_ob	float (7.9.8.1.2)	Gap between the breeding blanket module and the shield (outboard) in the equatorial section [m]; Scalar
dr_sh_vv_ob	float (7.9.8.1.2)	Gap between the shield and the vacuum vessel (outboard) in the equatorial section [m]; Scalar
dr_bb__sh_ib	float (7.9.8.1.2)	Overal radial dimension of the ensemble BB plus shield (inboard) [m]; Scalar
dr_bb__sh_ob	float (7.9.8.1.2)	Overal radial dimension of the ensemble BB plus shield (outboard) [m]; Scalar
delta_int	float (7.9.8.1.2)	Distance between the inner plasma surface and the plasma facing side of the superconducting winding of the toroidal field coil [m]; Scalar

Type of: bb_shield:geom (4129)

7.9.8.1.255 geom_iron

Geometry of the iron segments

member	type	description
npoints	vecint_type (7.9.8.1.19)	Number of points describing an element (irregular outline rzcoordinate); Vector (nsegment)
rzcoordinate	rz2D (7.9.8.1.390)	Irregular outline [m]; 2D arrays (nsegment,max_npoints)

Type of: desc_iron:geom_iron (4268)

7.9.8.1.256 global_param

0d output parameters

member	type	description
beta_pol	float (7.9.8.1.2)	poloidal beta; Time-dependent; Scalar
beta_tor	float (7.9.8.1.2)	toroidal beta; Time-dependent; Scalar
beta_normal	float (7.9.8.1.2)	normalised beta; Time-dependent; Scalar
i_plasma	float (7.9.8.1.2)	total toroidal plasma current [A]; Positive sign means anti-clockwise when viewed from above. Time-dependent; Scalar
li	float (7.9.8.1.2)	internal inductance; Time-dependent; Scalar
volume	float (7.9.8.1.2)	total plasma volume [m^3]; Time-dependent; Scalar
area	float (7.9.8.1.2)	area poloidal cross section [m^2]; Time-dependent; Scalar
psi_ax	float (7.9.8.1.2)	poloidal flux at the magnetic axis [Wb]; Time-dependent; Scalar
psi_bound	float (7.9.8.1.2)	poloidal flux at the selected plasma boundary (separatrix for a free boundary code; fixed boundary for fixed boundary code) [Wb]; Time-dependent; Scalar
mag_axis	mag_axis (7.9.8.1.286)	Magnetic axis values
q_95	float (7.9.8.1.2)	q at the 95% poloidal flux surface; Time-dependent; Scalar
q_min	float (7.9.8.1.2)	minimum q value in the plasma; Time-dependent; Scalar
toroid_field	b0r0 (7.9.8.1.82)	Characteristics of the vacuum toroidal field, redundant with the toroidfield CPO, to be used by the ETS
w_mhd	float (7.9.8.1.2)	Plasma energy content = 3/2 * int(p,dV) with p being the total pressure (thermal + fast particles) [J]. Time-dependent; Scalar

member	type	description
gamma	float (7.9.8.1.2)	Adiabatic index. Time-dependent; Scalar

Type of: equilibrium:global_param (4146)

7.9.8.1.257 globalparam

Various global quantities calculated from the 1D profiles. Time-dependent

member	type	description
current_tot	float (7.9.8.1.2)	Total plasma current [A]; Time-dependent; Scalar
current_bnd	float (7.9.8.1.2)	Plasma current inside transport solver boundary rho_tor_bnd [A]; Time-dependent; Scalar
current_ni	float (7.9.8.1.2)	Total non-inductive parallel current [A]; Time-dependent; Scalar
vloop	float (7.9.8.1.2)	Toroidal loop voltage [V]; Time-dependent; Scalar
li	float (7.9.8.1.2)	Internal inductance; Time-dependent; Scalar
beta_tor	float (7.9.8.1.2)	toroidal beta; Time-dependent; Scalar
beta_normal	float (7.9.8.1.2)	normalised beta; Time-dependent; Scalar
beta_pol	float (7.9.8.1.2)	poloidal beta; Time-dependent; Scalar
w_dia	float (7.9.8.1.2)	Plasma energy content = 3/2 * int(p,dV) with p being the total pressure (pr_th + pr_perp). Time-dependent; Scalar
geom_axis	rz0D (7.9.8.1.386)	RZ position of the geometric axis (defined as (Rmin+Rmax) / 2 and (Zmin+Zmax) / 2 of the boundary) [m]; Time-dependent; Scalar

Type of: coreprof:globalparam (4137)

7.9.8.1.258 halpha_setup

setup for the lines of sight of the line integrated measurement

member	type	description
name	vecstring_type (7.9.8.1.20)	Name of the channel. Array of strings (nlos).
pivot_point	rzphi1D (7.9.8.1.393)	Pivot point of l.o.s. it can be either the collimator position or entry point on the vessel. Vector (nlos)
horchordang	vecflt_type (7.9.8.1.18)	Angle [rad] of horizontal projection of l.o.s. with poloidal cross section (0 for HFS to LFS trajectory - see Convention_angles_interfdiag.pdf) [rad]. Vector (nlos)
verchordang	vecflt_type (7.9.8.1.18)	Angle of l.o.s. with vertical axis (0 for bottom-top trajectory, Pi for top-bottom trajectory - see Convention_angles_interfdiag.pdf) [rad]; Vector (npos)
second_point	rzphi1D (7.9.8.1.393)	Second point defining the l.o.s. together with the pivot_point. Vector (nlos)
solidangle	exp1D (7.9.8.1.225)	Solid angle of the detector; [sr] Vector (nlos)

Type of: halphadiag:setup (4148)

7.9.8.1.259 hcll

Data specific to HCLL blanket concept

member	type	description
mat_lim	mat_lim (7.9.8.1.289)	Material limits specific to HCLL breeding blanket
hcll_bb	hcll_bb (7.9.8.1.260)	HCLL breeding blanket. Radially, the blanket is divided in 4 layers: 1: First Wall, 2 : breeder zone, 3 : back plates, 4 : manifolds

Type of: bb_shield:hcll (4129)

7.9.8.1.260 hcll_bb

HCLL breeding blanket. Radially, the blanket is divided in 4 layers: 1: First Wall, 2 : breeder zone, 3 : back plates, 4 : manifolds

member	type	description
bb_lifetime	float (7.9.8.1.2)	Breeding blanket lifetime [years]; Scalar
he_inl_t	float (7.9.8.1.2)	Inlet temperature (to the bb module) [K]; Scalar
he_fr	float (7.9.8.1.2)	Coolant mass flow rate in ”the” reference bb module (or in each module) [Kg/s];

member	type	description
he_inl_p	float (7.9.8.1.2)	Helium inlet pressure [Pa]; Scalar
loca_des_p	float (7.9.8.1.2)	Box design pressure (coincident He circuit design pressure) [Pa]; Scalar
he_dp	float (7.9.8.1.2)	Coolant pressure drops in the breeding blankets [Pa]; Scalar
lipb_dp	float (7.9.8.1.2)	Pb-15.7Li pressure drops in the bb [Pa]; Scalar
react	react (7.9.8.1.373)	In the reactor region
inboard	hcllbb_specs (7.9.8.1.261)	Inboard
outboard	hcllbb_specs (7.9.8.1.261)	Outboard

Type of: hcll:hcll_bb (4362)

7.9.8.1.261 hcllbb_specs

Inboard

member	type	description
mass	vecflt_type (7.9.8.1.18)	Mass of inboard or outboard breeding blanket modules (located at equatorial midplane if only one considered) [Kg]; Vector(nmodules)
dr	vecflt_type (7.9.8.1.18)	Inboard or outboard breeding blanket radial build giving the thickness of each layer [m]; Vector(nlayers)
mat	vecflt_type (7.9.8.1.18)	Inboard or outboard breeding blanket materials; Vector(nlayers)
composition	matflt_type (7.9.8.1.15)	Inboard or outboard breeding blanket radial build giving for each layer (1: First Wall protective layer, 2: First Wall, 3 : breeder zone, 4 : back plates, 5 : manifolds), the percentage of each material respectively (Meaning of the material index 1: Eurofer, 2: Pb-15.7Li, 3: He, 4: Water, 5: Tungsten Carbide, 6: Boron, 7: Tungsten, 8: Stainless Steel 316) in %vol; Matrix(nlayers(=5), max_nmaterials)
mod_geom	bb_geometry (7.9.8.1.85)	Geometrical parameters of "the" reference region blanket module
mod_neutr	mode_neutr (7.9.8.1.299)	Neutrons "effects"
mod_therm	mode_therm (7.9.8.1.301)	Thermical parameters
mod_th_hyd	mode_th_hyd (7.9.8.1.300)	hydrodynamics parameters
mod_mech	mode_mech (7.9.8.1.298)	Mechanical parameters
mod_lipb	mode_lipb (7.9.8.1.297)	Pb-15.7Li "effects"
mod_tritium	mode_tritium (7.9.8.1.302)	Tritium parameters

Type of: hcll_bb:inboard (4363) I hcll_bb:outboard (4363)

7.9.8.1.262 holes

Structure to describe the placing and properties of the holes

member	type	description
n_holes	integer (7.9.8.1.3)	Number of holes on each wall;
coordinates	coordinates (7.9.8.1.130)	Poloidal and Toroidal coordinates of the center of each hole;
width	width (7.9.8.1.535)	Angular width of each in the poloidal and toroidal direction;
eta	vecflt_type (7.9.8.1.18)	Resistivity of each hole [ohm.m]; Vector (n_holes)

Type of: mhd_res_wall2d:holes (4397)

7.9.8.1.263 identifier

Standard type for identifiers. The three fields: id, flag and description are all representations of the same information. Associated with each application of this identifier-type, there should be a translation table defining the three fields for all objects to be identified.

member	type	description
id	string (7.9.8.1.4)	Short string identifier
flag	integer (7.9.8.1.3)	Integer identifier
description	string (7.9.8.1.4)	Verbose description of identifier

Type of: amns_processType:quality (4179) I composition_neutralscomp:type (4229) I compositions_type:signature (4230) I coredelta_values:deltaid (4235) I corefast_values:fastid (4237) I coreneutrals_atomlist:ionimptype (4252) I coresource_values:sourceid (4256) I coretransp_values:transportid (4260) I dist_sources_reference:type (4292) I enum_instance:type (4319) I fast_thermal_separation_filter:method (4331) I mhd_ideal_wall2d:walltype (4394) I mhd_res_wall2d:walltype (4397) I msediag_polarization:type (4409) I msediag_stokes:type (4414) I pellet_shape:type (4450) I reacprodType:role (4475) I reflectometry_antennas:type (4481) I reflectometry_radfield:type (4482) I simp_apert:type (4531) I species_reference:type (4542) I table:quality (4551) I temporary_nt_0dc:identifier (4555) I temporary_nt_0di:identifier (4556) I temporary_nt_0dr:identifier (4557) I temporary_nt_0ds:identifier (4558) I temporary_nt_1dc:identifier (4559) I temporary_nt_1di:identifier (4560) I temporary_nt_1dr:identifier (4561) I temporary_nt_1ds:identifier (4562) I temporary_nt_2dc:identifier (4563) I temporary_nt_2di:identifier (4564) I temporary_nt_2dr:identifier (4565) I temporary_nt_3dc:identifier (4566) I temporary_nt_3di:identifier (4567) I temporary_nt_3dr:identifier (4568) I temporary_nt_4dr:identifier (4569) I temporary_t_0dc:identifier (4571) I temporary_t_0di:identifier (4572) I temporary_t_0dr:identifier (4573) I temporary_t_0ds:identifier (4574) I temporary_t_1dc:identifier (4575) I temporary_t_1di:identifier (4576) I temporary_t_1dr:identifier (4577) I temporary_t_2dc:identifier (4578) I temporary_t_2di:identifier (4579) I temporary_t_2dr:identifier (4580) I temporary_t_3dc:identifier (4581) I temporary_t_3di:identifier (4582) I temporary_t_3dr:identifier (4583) I temporary_t_4dr:identifier (4584) I trap_type:trap_id (4596) I wall2d:wall_id (4612) I wall3d:wall_id (4614) I wall_limiter:limiter_id (4617) I wall_vessel:vessel_id (4622) I weighted_markers:variable_ids (4636)

7.9.8.1.264 impcoeff

Array over charge states for this particular impurity.

member	type	description
chargestate(:)	coefficients_neutrals (7.9.8.1.106)	Time-dependent

Type of: coreneutrals:impcoeff (4136)

7.9.8.1.265 impurities

Array of impurities.

member	type	description
nucindex	integer (7.9.8.1.3)	Index into list of nuclei; int
i_ion	integer (7.9.8.1.3)	Index of the impurity species in the ions array of structures. Vector (nimp)
nzimp	integer (7.9.8.1.3)	Number of charge states (or bundles) considered for this impurity species.
zmin	vecflt_type (7.9.8.1.18)	Minimum Z of impurity ionisation state bundle. Vector (nzimp)
zmax	vecflt_type (7.9.8.1.18)	Maximum Z of impurity ionisation state bundle. If no bundle, zmax=zmin. Vector (nzimp)
label	vecstring_type (7.9.8.1.20)	String array (nzimp) identifying impurities (e.g. C+, C+2 , C+3, C+4, C+5, C+6, ...)

Type of: compositions_type:impurities (4230)

7.9.8.1.266 impurity_type

Array(nimp). Time-dependent

member	type	description
z	matflt_type (7.9.8.1.15)	Impurity ionisation state (averaged for bundle); Time-dependent; Array2D (nrho,nzimp)
zsq	matflt_type (7.9.8.1.15)	Z^2, Square of impurity ionisation state (averaged for bundle); Time-dependent; Array2D (nrho,nzimp)
nz	matflt_type (7.9.8.1.15)	Density of impurity in a given charge state [m^-3]. Time-dependent; Array2D (nrho,nzimp)
tz	matflt_type (7.9.8.1.15)	Temperature of impurity in a given charge state [m^-3]. Time-dependent; Array2D (nrho,nzimp)
source_term	sourceimp (7.9.8.1.436)	Source term for each charge state. Time-dependent.
boundary	boundaryimp (7.9.8.1.96)	Boundary condition for each charge state. Time-dependent
transp_coef	coretransimp (7.9.8.1.155)	Transport coefficients for each charge state
flux	fluximp (7.9.8.1.234)	Fluxes of impurity particles, two definitions [m^-2.s^-1]. Time-dependent.
time_deriv	matflt_type (7.9.8.1.15)	Integral of the time derivative term of the transport equation. Time-dependent. Array2D (nrho,nzimp)
diagnostic	coreimpurediag_type (7.9.8.1.146)	NO DOCS

Type of: coreimpur:impurity (4135)

7.9.8.1.267 inj_spec

Injected species

member	type	description
amn	float (7.9.8.1.2)	Atomic mass number
zn	float (7.9.8.1.2)	Nuclear charge

Type of: nbi_unit:inj_spec (4417)

7.9.8.1.268 ions

Array of main plasma ions.

member	type	description
nucindex	integer (7.9.8.1.3)	Index into list of nuclei; int
zion	float (7.9.8.1.2)	Ion charge (of the dominant ionisation state; lumped ions are allowed); Vector (nion)
imp_flag	integer (7.9.8.1.3)	Multiple charge state calculation flag : 0-Only one charge state is considered; 1-Multiple charge state are considered and are described in impurity CPO; Vector (nion)
label	string (7.9.8.1.4)	String identifying ion (e.g. H+, D+, T+, He+2, C+, ...)

Type of: compositions_type:ions (4230)

7.9.8.1.269 isoflux

Point series at which the flux is considered the same

member	type	description
position	rz1D (7.9.8.1.387)	Position of the points at which the flux is considered the same; Time-dependent; Vector (nmeas)
source	string (7.9.8.1.4)	Description or path to the source signal (diagnostic or genprof, from which to read all info on the signal), e.g. 'magdiag/bpol_probes/measure/value'. String
weight	vecflt_type (7.9.8.1.18)	weight given to the measurement (¿= 0); -1 if exact data; Time-dependent; Vector (nmeas)
sigma	vecflt_type (7.9.8.1.18)	standard deviation of the measurement; Time-dependent; Vector (nmeas)
calculated	vecflt_type (7.9.8.1.18)	Signal as recalculated by the equilibrium code; Time-dependent; Vector (nmeas)
chi2	vecflt_type (7.9.8.1.18)	chi^2 of (calculated-measured); Time-dependent; Vector (nmeas)

Type of: eqconstraint:isoflux (4320)

7.9.8.1.270 jni

Non-inductive parallel current density [A/m^2]; Time-dependent;

member	type	description
value	vecflt_type (7.9.8.1.18)	Value of jni; Time-dependent; Vector (nrho)
integral	vecflt_type (7.9.8.1.18)	Integral from 0 to rho of jni. Time-dependent; Vector (nrho)
source	string (7.9.8.1.4)	Source of the profile (any comment describing the origin of the profile : code, path to diagnostic signals, massaging, ...); String

Type of: psi:jni (4472)

7.9.8.1.271 lang_derived

Structure for physics quantities derived from Langmuir probe measurements

member	type	description
source	vecstring_type (7.9.8.1.20)	Probes in probe holder used to derive measure. String vector
position	rzphi1Dexp (7.9.8.1.394)	Position of the measurement. Time-dependent.
measure	exp1D (7.9.8.1.225)	Measured quantity. Time-dependent.

Type of: langmuirdiag:machpar (4152) I langmuirdiag:ne (4152) I langmuirdiag:te (4152)

7.9.8.1.272 lang_measure

Structure for elementary Langmuir probe measurement

member	type	description
name	vecstring_type (7.9.8.1.20)	Name of the probe e.g. Jsatur1,Vfloat1). String vector
direction	vecstring_type (7.9.8.1.20)	Direction of the probe w.r.t. magnetic field. For Mach arrangement use 'co ' (co-field) and 'ct ' (counter field) for the pair, otherwise use 'both'. String vector
area	exp1D (7.9.8.1.225)	Effective area of probe [m^2]. Time-dependent.
position	rzphi1Dexp (7.9.8.1.394)	Position of the measurement. Time-dependent.
measure	exp1D (7.9.8.1.225)	Measured quantity. Time-dependent.

Type of: langmuirdiag:bias (4152) I langmuirdiag:jsat (4152) I langmuirdiag:potential (4152)

7.9.8.1.273 launchangles

Launching angles of the beam

member	type	description
alpha	float (7.9.8.1.2)	Poloidal launching angle between the horizontal plane and the poloidal component of the nominal beam centerline [rad], Tan(alpha)=-k_z/k_R; Time-dependent
beta	float (7.9.8.1.2)	Toroidal launching angle between the poloidal plane and the nominal beam centerline [rad], Sin(beta)=k_phi; Time-dependent

Type of: antenna_ec:launchangles (4180)

7.9.8.1.274 launchs_parallel

Power spectrum as a function of the parallel refractive index.

member	type	description
nn_par	vecint_type (7.9.8.1.19)	Number of points for the discretization of the spectrum in the poloidal direction, Vector of integers (nantenna).
n_par	matflt_type (7.9.8.1.15)	Refraction index in the parallel direction, Matrix (nantenna,max_nn_par).
power	vecflt_type (7.9.8.1.18)	W/dN_par [W], Matrix(nantenna, max_nn_par). Time-dependent

Type of: spectrum:parallel (4544)

7.9.8.1.275 launchs_phi_theta

Power spectrum as a function of the refractive index in the toroidal and poloidal directions.

member	type	description
nn_phi	vecint_type (7.9.8.1.19)	Number of points for the discretization of the spectrum in the toroidal direction, Vector of integers (nantenna).
nn_theta	vecint_type (7.9.8.1.19)	Number of points for the discretization of the spectrum in the poloidal direction, Vector of integers (nantenna).
n_phi	matflt_type (7.9.8.1.15)	Refraction index in the toroidal direction, Matrix (nantenna,max_nn_phi).
n_theta	matflt_type (7.9.8.1.15)	Refraction index in poloidal direction, Matrix (nantenna,max_nn_theta).
power	array3dflt_type (7.9.8.1.7)	W/dNphi/dNtheta [W], Array (nantenna, max_nn_phi, max_nn_theta). Time-dependent

Type of: spectrum:phi_theta (4544)

7.9.8.1.276 launchs_rfbeam

Beam characteristics (RF wave description)

member	type	description
spot	launchs_rfbeam_spot (7.9.8.1.278)	Spot characteristics
phaseellipse	launchs_rfbeam_phaseellipse (7.9.8.1.277)	Phase ellipse characteristics of the spot

Type of: launchs:beam (4153)

7.9.8.1.277 launchs_rfbeam_phaseellipse

Phase ellipse characteristics of the spot

member	type	description
invcurvrad	matflt_type (7.9.8.1.15)	Inverse curvature radii for the phase ellipse [m-1], Matrix (nantenna,2). Time-dependent
angle	vecflt_type (7.9.8.1.18)	Rotation angle for the phase ellipse [rd], Vector(nantenna). Time-dependent

Type of: launchs_rfbeam:phaseellipse (4379)

7.9.8.1.278 launchs_rfbeam_spot

Spot characteristics

member	type	description
waist	matflt_type (7.9.8.1.15)	Waist for the spot ellipse [m], Matrix (nantenna,2). Time-dependent
angle	vecflt_type (7.9.8.1.18)	Rotation angle for the spot ellipse [rd], Vector(nantenna). Time-dependent

Type of: launchs_rfbeam:spot (4379)

7.9.8.1.279 launchsignal

member	type	description
time_launch	vecflt_type (7.9.8.1.18)	Time stamp for particular event e.g. ramp of frequency sweep (but it should not be needed since it should be tied to the cpo time !); Time-dependent
freq	vecflt_type (7.9.8.1.18)	Frequency of the injected waves (should not be needed since it is already used in the injected signal !), typical data stored experimentally; Time-dependent
amplitude	vecflt_type (7.9.8.1.18)	Amplitude of the injected waves (essential if using gaussian, already encoded in the Electric field pattern), typical data stored experimentally; Time-dependent
phase	vecflt_type (7.9.8.1.18)	Phase of the sinusoidal (e.g. voltage) signal injected in the antenna, typical data stored experimentally; Time-dependent

Type of: reflectometry_antennas:launchsignal (4481)

7.9.8.1.280 limiter_unit

Vector of limiting surfaces. Replicate this limiter_unit element ncomponents times. Each unit contains a plasma facing component that can have dedicated number of points. Array of structures (ncomponents)

member	type	description
name	string (7.9.8.1.4)	Name or description of the limiter_unit
closed	string (7.9.8.1.4)	Identify whether the contour is closed (y) or open (n)
position	rz1D (7.9.8.1.387)	Position (R,Z coordinates) of a limiting surface. No need to repeat first point for closed contours [m]; Vector(npoints)
eta	float (7.9.8.1.2)	Wall resistivity [ohm.m]; Scalar
delta	float (7.9.8.1.2)	Wall thickness [m] (Optional if a closed facing component is given but useful for simpler closed contour limiter); Time-dependent; Scalar
permeability	float (7.9.8.1.2)	Vessel relative permeability; Scalar

Type of: wall_limiter:limiter_unit (4617)

7.9.8.1.281 limits

Limits

member	type	description
fw_dpa	float (7.9.8.1.2)	max allowable displacement per atom on FW [dpa]; Scalar.
he_appm	float (7.9.8.1.2)	He concentration limit in re-welding areas [appm]; Scalar
ins_dose	float (7.9.8.1.2)	Integral radiation dose in insulator (Epoxy) [Gy] [J*Kg^-1]; Scalar
fn_flu	float (7.9.8.1.2)	Peak fast neutron fluence (E¿0.1 MeV) to the Nb3Sn superconductor [m^-2]; Scalar

member	type	description
dpa_cu	float (7.9.8.1.2)	Peak displacement damage to copper stabilizer [dpa]; Scalar
wp_nh	float (7.9.8.1.2)	Peak nuclear eating in winding pack [W*m^-3]; Scalar

Type of: bb_shield:limits (4129)

7.9.8.1.282 lineintegraldiag

General line integral diagnostic

member	type	description
datainfo	datainfo (7.9.8.1.162)	Generic information on a data item
expression	string (7.9.8.1.4)	Formal expression for the line integral to be evaluated as a function of ne, ni, Te, Ti, Zeff, Br, Bz
setup_line	setup_line (7.9.8.1.424)	Geometric description of the lines of sight
measure	exp1D (7.9.8.1.225)	Measured value. Time-dependent; Vector (nchords)
codeparam	codeparam (7.9.8.1.105)	Code parameters
time	float (7.9.8.1.2)	Time [s]; Time-dependent; Scalar

7.9.8.1.283 lithmeasure

Measured values

member	type	description
ne	exp1D (7.9.8.1.225)	Electron density [m^-3]. Vector (nchannels)

Type of: lithiumdiag:measure (4154)

7.9.8.1.284 lithsetup

diagnostic setup information

member	type	description
position	rzphi1D (7.9.8.1.393)	Position of the measurement. Vector (nchannels)

Type of: lithiumdiag:setup (4154)

7.9.8.1.285 local

TO BE REMOVED, being replaced by e_components and grid. Kept only to make smooth transition between data-type versions. [Local description of the wave fields. Uses the grid in grid_2d].

member	type	description
e_plus	array3dflt_type (7.9.8.1.7)	Magnitude of left hand polarised component of the wave electric field [V/m]; Time-dependent; Array 3D (ntor, ndim1, ndim2)
e_plus_ph	array3dflt_type (7.9.8.1.7)	Phase of left hand polarised component of the wave electric field [rad]; Time-dependent; Array 3D (ntor, ndim1, ndim2)
e_minus	array3dflt_type (7.9.8.1.7)	Magnitude of right hand polarised component of the wave electric field [v/m]; Time-dependent; Array 3D (ntor, ndim1, ndim2)
e_minus_ph	array3dflt_type (7.9.8.1.7)	Phase of right hand polarised component of the wave electric field [rad]; Time-dependent; Array 3D (ntor, ndim1, ndim2)
e_norm	array3dint_type (7.9.8.1.8)	Magnitude of wave electric field normal to a flux surface [V/m]; Time-dependent; 3D (ntor, ndim1, ndim2)
enorm_ph	array3dflt_type (7.9.8.1.7)	Phase of wave electric field normal to a flux surface [rad]; Time-dependent; 3D (ntor, ndim1, ndim2)
e_binorm	array3dflt_type (7.9.8.1.7)	Magnitude of wave electric field tangent to a flux surface [V/m]; Time-dependent; 3D (ntor, ndim1, ndim2)
e_binorm_ph	array3dflt_type (7.9.8.1.7)	Phase of wave electric field tangent to a flux surface [rad]; Time-dependent; 3D (ntor, ndim1, ndim2)
e_para	array3dflt_type (7.9.8.1.7)	Magnitude of parallel wave electric field [V/m]; Time-dependent; Array 3D (ntor, ndim1, ndim2)
e_para_ph	array3dflt_type (7.9.8.1.7)	Phase of parallel wave electric field [rad]; Time-dependent; Array 3D (ntor, ndim1, ndim2)
b_norm	array3dflt_type (7.9.8.1.7)	Magnitude of wave magnetic field normal to a flux surface [T]; Time-dependent; Array 3D (ntor, ndim1, ndim2)
b_norm_ph	array3dflt_type (7.9.8.1.7)	Phase of wave magnetic field normal to a flux surface [rad]; Time-dependent; Array 3D (ntor, ndim1, ndim2)

member	type	description
b_binorm	array3dflt_type (7.9.8.1.7)	Magnitude of wave magnetic field tangent to a flux surface [T]; Time-dependent; Array 3D (ntor, ndim1, ndim2)
b_binorm_ph	array3dflt_type (7.9.8.1.7)	Phase of wave magnetic field tangent to a flux surface [rad]; Time-dependent; Array 3D (ntor, ndim1, ndim2)
b_para	array3dflt_type (7.9.8.1.7)	Magnitude of wave magnetic field parallel to the equilibrium magnetic field [T]; Time-dependent; Array 3D (ntor, ndim1, ndim2)
b_para_ph	array3dflt_type (7.9.8.1.7)	Phase of wave magnetic field parallel to the equilibrium magnetic field [rad]; Time-dependent; Array 3D (ntor, ndim1, ndim2)
k_perp	array3dflt_type (7.9.8.1.7)	Perpendicular wave number [T]; Time-dependent; Array 3D (ntor, ndim1, ndim2)

Type of: fullwave:local (4340)

7.9.8.1.286 mag_axis

Magnetic axis values

member	type	description
position	rz0D (7.9.8.1.386)	Position of the magnetic axis [m]; Time-dependent; Scalar;
bphi	float (7.9.8.1.2)	Total toroidal magnetic field at the magnetic axis [T]; Time-dependent; Scalar
q	float (7.9.8.1.2)	q at the magnetic axis; Time-dependent; Scalar

Type of: global_param:mag_axis (4359)

7.9.8.1.287 magnet_iron

Magnetisation in iron segments [T]

member	type	description
mr	eqmes1D (7.9.8.1.220)	Magnetisation along the R axis [T];
mz	eqmes1D (7.9.8.1.220)	Magnetisation along the Z axis [T];

Type of: eqconstraint:magnet_iron (4320)

7.9.8.1.288 magnetise

Magnetisation M of the iron segment, assumed to be constant inside a given iron segment. Reminder : H = 1/mu0 * B - mur * M; [A/m].

member	type	description
mr	exp1D (7.9.8.1.225)	Magnetisation along the R axis [T]; Time-dependent; Vector (nsegment)
mz	exp1D (7.9.8.1.225)	Magnetisation along the Z axis [T]; Time-dependent; Vector (nsegment)

Type of: ironmodel:magnetise (4151)

7.9.8.1.289 mat_lim

Material limits specific to HCLL breeding blanket

member	type	description
cool_t_lim	float (7.9.8.1.2)	Min, max allowable He temperature [K];
steel_t_lim	float (7.9.8.1.2)	Min, max allowable steel temperature [K];
lipb_t_lim	float (7.9.8.1.2)	Min, max allowable LiPb temperature [K];

Type of: hcll:mat_lim (4362)

7.9.8.1.290 mdinfo

Information related to machine description for this entry

member	type	description

member	type	description
shot_min	integer (7.9.8.1.3)	Minimum shot number to which the machine description applies
shot_max	integer (7.9.8.1.3)	Maximum shot number to which the machine description applies
md_entry	entry_def (7.9.8.1.215)	Entry of the machine description used. NB : just for information : for the moment, no guarantee that machine description data have not been modified with respect to the data in md_entry. Machine description data are written explicitely in each CPO.

Type of

7.9.8.1.291 mhd_ideal_wall2d

Ideal wall

member	type	description
walltype	identifier (7.9.8.1.263)	Tag the type of wall to be used, 0 (conformal) or 1 (free)
position	rz1D (7.9.8.1.387)	RZ description of the wall;

Type of: wall2d_mhd:ideal_wall (4613)

7.9.8.1.292 mhd_mode

MHD modes in the confined plasma

member	type	description
modenum	integer (7.9.8.1.3)	Toroidal mode number of the MHD mode; Scalar; Time-dependent.
growthrate	float (7.9.8.1.2)	Linear growthrate of the mode [Hz]; Scalar; Time-dependent.
frequency	float (7.9.8.1.2)	Frequency of the mode [Hz]; Scalar; Time-dependent.
plasma	mhd_plasma (7.9.8.1.293)	MHD modes in the confined plasma
vacuum	mhd_vacuum (7.9.8.1.295)	External modes

Type of: mhd:n (4156)

7.9.8.1.293 mhd_plasma

MHD modes in the confined plasma

member	type	description
psi	vecflt_type (7.9.8.1.18)	Position in poloidal flux [Wb] (without 1/2pi and such that Bp=|grad psi| /R/2/pi). Time-dependent; Vector (npsi)
rho_tor_norm	vecflt_type (7.9.8.1.18)	Normalised toroidal flux coordinate values (= rho_tor normalised to the value at the last grid point); Time-dependent; Vector (nrho)
rho_tor	vecflt_type (7.9.8.1.18)	Toroidal flux coordinate (not normalised, equivalent to rho_tor_norm) [m]; Vector (nrho). Time-dependent.
m	matflt_type (7.9.8.1.15)	Poloidal mode number; Time-dependent; Array2D (npsi,nm)
disp_perp	matcplx_type (7.9.8.1.14)	Perpendicular displacement of the mode (in Fourier space) [m]; Time-dependent; Array 2D (npsi,nm)
disp_par	matcplx_type (7.9.8.1.14)	Parallel displacement of the mode (in Fourier space) [m]; Time-dependent; Array 2D (npsi,nm)
tau_alfven	vecflt_type (7.9.8.1.18)	Alven time=R/vA=R0 sqrt(mi ni(rho))/B0 [s]; Definitions of R0, BO, mi, ni to be clarified. rho grid should be included in the MHD CPO ? Time-dependent; Vector (npsi)
tau_res	vecflt_type (7.9.8.1.18)	Resistive time = mu_0 rho*rho/1.22/eta_neo [s]; Source of eta_neo to be clarified. Time-dependent; Vector (npsi)
coord_sys	coord_sys (7.9.8.1.129)	flux surface coordinate system on a square grid of flux and angle
a_pert	mhd_vector (7.9.8.1.296)	Pertubed vector potential (in Fourier space) [T.m]
b_pert	mhd_vector (7.9.8.1.296)	Perturbed magnetic field (in Fourier space) [T]
v_pert	mhd_vector (7.9.8.1.296)	Perturbed velocity (in Fourier space) [m/s]
p_pert	matcplx_type (7.9.8.1.14)	Perturbed pressure (in Fourier space) [Pa]; Time-dependent; Array 2D (npsi,nm)
rho_mass_per	matcplx_type (7.9.8.1.14)	Perturbed mass density (in Fourier space) [kg/m^3]; Time-dependent; Array 2D (npsi,nm)
temp_per	matcplx_type (7.9.8.1.14)	Perturbed temperature (in Fourier space) [eV]; Time-dependent; Array 2D (npsi,nm)

Type of: mhd_mode:plasma (4395)

7.9.8.1.294 mhd_res_wall2d

Resistive wall

member	type	description
walltype	identifier (7.9.8.1.263)	Tag the type of wall to be used, 0 (conformal) or 1 (free)
delta	float (7.9.8.1.2)	Wall thickness [m]; Scalar
eta	float (7.9.8.1.2)	Wall resistivity [ohm.m]; Scalar
npoloidal	integer (7.9.8.1.3)	Number of poloidal coordinates for each wall (dimension of R and Z);
position	rz1D (7.9.8.1.387)	RZ description of the wall; wall coordinates are defined at a middle line (line passing through the middle of the real wall as defined by thickness parameter delta)
holes	holes (7.9.8.1.262)	Structure to describe the placing and properties of the holes

Type of: wall2d_mhd:res_wall (4613)

7.9.8.1.295 mhd_vacuum

External modes

member	type	description
m	matflt_type (7.9.8.1.15)	Poloidal mode number; Time-dependent; Array2D (npsi,nm)
coord_sys	coord_sys (7.9.8.1.129)	flux surface coordinate system on a square grid of flux and angle
a_pert	mhd_vector (7.9.8.1.296)	Pertubed vector potential (in Fourier space) [T.m]
b_pert	mhd_vector (7.9.8.1.296)	Perturbed magnetic field (in Fourier space) [T]

Type of: mhd_mode:vacuum (4395)

7.9.8.1.296 mhd_vector

Vector structure for MHD CPO

member	type	description
coord1	matcplx_type (7.9.8.1.14)	Fourier components of first coordinate; Time-dependent; Array 2D (npsi,nm)
coord2	matcplx_type (7.9.8.1.14)	Fourier components of second coordinate; Time-dependent; Array 2D (npsi,nm)
coord3	matcplx_type (7.9.8.1.14)	Fourier components of third coordinate; Time-dependent; Array 2D (npsi,nm)

Type of: mhd_plasma:a_pert (4396) I mhd_plasma:b_pert (4396) I mhd_plasma:v_pert (4396) I mhd_vacuum:a_pert (4398) I mhd_vacuum:b_pert (4398)

7.9.8.1.297 mode_lipb

Pb-15.7Li ”effects”

member	type	description
lp_rec_day	float (7.9.8.1.2)	nb of Pb-15.7Li recirculation per day [Pa]; Scalar
bb_lp_fr	vecflt_type (7.9.8.1.18)	Pb-15.7Li mass flow rate in ”the” bb module (or in each bb module) [Kg/s]; Vector(nmodules)
lp_inl_p	float (7.9.8.1.2)	Pb-15.7Li inlet pressure [Pa]; Scalar
bu_dp_lp	float (7.9.8.1.2)	Pb-15.7Li pressure drops in the breeder unit [Pa]; Scalar
man_dp_lp	float (7.9.8.1.2)	Pb-15.7Li pressure drops in the bb manifolds [Pa]; Scalar
tot_dp_lp	float (7.9.8.1.2)	Pb-15.7Li total pressure drops [Pa]; Scalar
bu_lp_ave_t	float (7.9.8.1.2)	Pb-15.7Li average temperature in a breeder unit [K]; Scalar
bu_lp_max_t	float (7.9.8.1.2)	Pb-15.7Li max temperature in a breeder unit [K]; Scalar

Type of: hcllbb_specs:mod_lipb (4364)

7.9.8.1.298 mode_mech

Mechanical parameters

member	type	description
fw_min_ts_mg	float (7.9.8.1.2)	Min margin to tensile stress limit in the first wall; Scalar
fw_min_bd_mg	float (7.9.8.1.2)	Min margin to banding stress limit in the first wall; Scalar

member	type	description
sg_min_ts_mg	float (7.9.8.1.2)	Min margin to tensile stress limit in the stiffening grid; Scalar
sg_min_bd_mg	float (7.9.8.1.2)	Min margin to bending stress limit in the stiffening grid; Scalar
cp_min_ts_mg	float (7.9.8.1.2)	Min margin to tensile stress limit in the cooling plate; Scalar
cp_min_bd_mg	float (7.9.8.1.2)	Min margin to bending stress limit in the cooling plate; Scalar
min_ts_mg_ac	float (7.9.8.1.2)	Min tensile margin in accidental conditions; Scalar
min_bd_mg_ac	float (7.9.8.1.2)	Min bending margin in accidental conditions; Scalar

Type of: hcllbb_specs:mod_mech (4364)

7.9.8.1.299 mode_neutr

Neutrons "effects"

member	type	description
r	vecflt_type (7.9.8.1.18)	Major radius position at wich power density is calculated [m]; Vector(nr)
pd_rad	vecflt_type (7.9.8.1.18)	Power density distribution in radial direction [W/m^3]; Vector(nr)
lipb_coef_pd	vecflt_type (7.9.8.1.18)	Pb-15.7Li power density distribution in radial direction: coefficients of bi-exponential law if this one is used [W/m^-3,W/m^-3,m^-1,m^-1]; Matrix
steel_coef_pd	vecflt_type (7.9.8.1.18)	Eurofer power density distribution in radial direction: coefficients of bi-exponential law if this one is used
pow_exchange	power_exchange (7.9.8.1.365)	NO DOCS

Type of: hcllbb_specs:mod_neutr (4364)

7.9.8.1.300 mode_th_hyd

hydrodynamics parameters

member	type	description
fw_dp_he	float (7.9.8.1.2)	Pressure drops in the first wall [Pa]; Scalar
sg_dp_he	float (7.9.8.1.2)	Pressure drops in the stiffening grid [Pa]; Scalar
cp_dp_he	float (7.9.8.1.2)	Pressure drops in the cooling plates [Pa]; Scalar
man_dp_he	float (7.9.8.1.2)	Pressure drops in the manifolds [Pa]; Scalar
tot_dp_he	float (7.9.8.1.2)	Total pressure drops in bb module [Pa]; Scalar
bp_dp_he	float (7.9.8.1.2)	Total pressure drops in the by pass (if any) [Pa]; ScalarScalar
circ_dp_he	float (7.9.8.1.2)	Pressure drops in one He circuit [Pa]; Scalar

Type of: hcllbb_specs:mod_th_hyd (4364)

7.9.8.1.301 mode_therm

Thermical parameters

member	type	description
he_fr	float (7.9.8.1.2)	Coolant mass flow rate in "the" reference bb (inboard or outboard) module [Kg/s]; Scalar
perc_bp_he	float (7.9.8.1.2)	% of Helium going through the bypass (set to 0 if not otherwise specified)
he_out_t	float (7.9.8.1.2)	Outlet temperature (from the bb module) [K]; Scalar
fw_he_out_t	float (7.9.8.1.2)	First wall outlet temperature [K]; Scalar
sg_he_out_t	float (7.9.8.1.2)	Stiffening grid outlet temperature [K]; Scalar
cp_he_out_t	float (7.9.8.1.2)	Cooling plates outlet temperature [K]; Scalar
fw_st_max_t	float (7.9.8.1.2)	First wall eurofer maximum temperature [K]; Scalar
sg_st_max_t	float (7.9.8.1.2)	Stiffening grid eurofer maximum temperature [K]; Scalar
cp_st_max_t	float (7.9.8.1.2)	Cooling plates eurofer maximum temperature [K]; Scalar

Type of: hcllbb_specs:mod_therm (4364)

7.9.8.1.302 mode_tritium

Tritium parameters

member	type	description
t_conc_lipb	float (7.9.8.1.2)	Tritium concentration in Pb-15.7Li; Scalar
t_conc_he	float (7.9.8.1.2)	Tritium concentration in He; Scalar

Type of: hcllbb_specs:mod_tritium (4364)

7.9.8.1.303 modules

Modules description. NB there are nmodules per antenna, distributed among nma_phi toroidal positions and nma_theta poloidal positions

member	type	description
nma_theta	integer (7.9.8.1.3)	Number of modules per antenna in the poloidal direction.
nma_phi	integer (7.9.8.1.3)	Number of modules per antenna in the toroidal direction.
ima_theta	vecint_type (7.9.8.1.19)	Position index of the module in the poloidal direction (from low theta to high theta, i.e. from bottom to top if the antenna is on LFS). Vector of integers (nmodules).
ima_phi	vecint_type (7.9.8.1.19)	Position index of the module in the toroidal direction (from low phi to high phi, counter-clockwise when seen from above). Vector of integers (nmodules).
sm_theta	float (7.9.8.1.2)	Spacing between poloidally neighboring modules [m]
amplitude	exp1D (7.9.8.1.225)	Amplitude of the TE10 mode injected in the module [W], Vector exp1d (nmodules). Time-dependent
phase	exp1D (7.9.8.1.225)	Phase of the TE10 mode injected in the module [radians], Vector exp1d (nmodules). Time-dependent
waveguides	waveguides (7.9.8.1.525)	Waveguides description

Type of: antennalh_setup:modules (4184)

7.9.8.1.304 msediag_emiss_chord

MSE Emissivity characterization. This structure is used for each line of sight of the MSE setup and contains the geometry of the line of sight, the emissivity(wavelength,pos) for each polarization state along the line of sight, the quantization axis and the emission volume. Replicate the structure for each line of sight.

member	type	description
volume	float (7.9.8.1.2)	Emitting volume (m^-3). Scalar
setup	rzphi1D (7.9.8.1.393)	Description of the line of sight (for the moment a line - not a cone of sight). Vector (npos).
polarization(:)	msediag_polarization (7.9.8.1.306)	Polarized and unpolarized emissivity of the relevant MSE spectral lines. Structure Array (ncomp). Time-dependent.
quantiaxis	vecflt_type (7.9.8.1.18)	Quantization axis for the line of sight (eR,ePhi,eZ). It is a unitary vector associated to the line of sight and to the emissivity, e.g. the Lorentzian electric field direction); Vector (3). Time-dependent

Type of: msediag_emissivity:emiss_chord (4408)

7.9.8.1.305 msediag_emissivity

Emissivity characteristics.

member	type	description
wavelength	vecflt_type (7.9.8.1.18)	Wavelength [m]. Vector (nwavelength)
emiss_chord(:)	msediag_emiss_chord (7.9.8.1.304)	MSE Emissivity characterization. This structure is used for each line of sight of the MSE setup and contains the geometry of the line of sight, the emissivity(wavelength,pos) for each polarization state along the line of sight, the quantization axis and the emission volume. Replicate the structure for each line of sight. Time-dependent

Type of: spectral:emissivity (4543)

7.9.8.1.306 msediag_polarization

Polarized and unpolarized emissivity of the relevant MSE spectral lines. Structure Array (ncomp). Time-dependent.

member	type	description
type	identifier (7.9.8.1.263)	Type of the polarization. 0 for unpolarised, 1 for Pi, 2 for sigma^+ and 3 for sigma^-
spec_emiss	matflt_type (7.9.8.1.15)	Spectral emissivity of a particular polarization (Wm^-3sr-^1). Matrix (npos,nwavelength). Time-dependent

Type of: msediag_emiss_chord:polarization (4407)

7.9.8.1.307 msediag_radia_chord

MSE radiance characterization. This structure is used for each line of sight of the MSE setup and contains the geometry of the line of sight, the radiance(wavelength) for each polarization state, the quantization axis. Replicate the structure for each line of sight.

member	type	description
setup	msediag_setup (7.9.8.1.309)	Geometry for the observation line of sight
stokes(:)	msediag_stokes (7.9.8.1.311)	Stokes vector (I,U,S,V) as a function of the wavelength for the polarized and unpolarized relevant MSE spectral lines. Replicate for each spectral component. Structure array (ncomp). Time-dependent.
totradiance	exp1D (7.9.8.1.225)	Total Radiance integrated along the lines of sight (Wm^-2sr-^1). Vector (nwavelength)

Type of: msediag_radiance:radia_chord (4411)

7.9.8.1.308 msediag_radiance

Emissivity characteristics.

member	type	description
wavelength	exp1D (7.9.8.1.225)	Wavelength [m]. Vector (nwavelength)
radia_chord(:)	msediag_radia_chord (7.9.8.1.307)	MSE radiance characterization. This structure is used for each line of sight of the MSE setup and contains the geometry of the line of sight, the radiance(wavelength) for each polarization state, the quantization axis. Replicate the structure for each line of sight. Time-dependent

Type of: spectral:radiance (4543)

7.9.8.1.309 msediag_setup

Geometry for the observation line of sight

member	type	description
pivot_point	rzphi0D (7.9.8.1.392)	Pivot point of mse line of sight. Scalar
horchordang	float (7.9.8.1.2)	Angle [rad] of horizontal projection of mse line of sight with poloidal cross section (0 for HFS to LFS trajectory - see Convention_angles_interfdiag.pdf) [rad]. Scalar
verchordang	float (7.9.8.1.2)	Angle of mse line of sight with vertical axis (0 for bottom-top trajectory, Pi for top-bottom trajectory - see Convention_angles_interfdiag.pdf) [rad]; Scalar
second_point	rzphi0D (7.9.8.1.392)	Second point defining the mse line of sight together with the pivot_point. Scalar

Type of: msediag_radia_chord:setup (4410)

7.9.8.1.310 msediag_setup_polarimetry

diagnostic setup information

member	type	description
rzgamma	rzphidrdzdphi1D (7.9.8.1.398)	Position and width of the intersection between beam and line of sight. Vectors (nchords)
geom_coef	matflt_type (7.9.8.1.15)	Geometric coefficients (9) describing the angle between beam and line of sight; The first dimension contains succesively : numerator, coefficients of BZ, BR, Bphi, ER; denominator, coefficients of BZ, BR, Bphi, ER, EZ; Matrix (9,nchords). In versions of the data structure before 4.08, there were only 6 coefficients namely : numerator, coefficients of BZ, BR, Bphi; denominator, coefficients of BZ, BR, Bphi.

Type of: polarimetry:setup (4465)

7.9.8.1.311 msediag_stokes

Stokes vector (I,U,S,V) as a function of the wavelength for the polarized and unpolarized relevant MSE spectral lines. Replicate for each spectral component. Structure array (ncomp). Time-dependent.

member	type	description
type	identifier (7.9.8.1.263)	Type of the polarization. 0 for unpolarised, 1 for Pi, 2 for sigma^+ and 3 for sigma^-
vector	matflt_type (7.9.8.1.15)	Stokes vector (I,U,S,V) as a function of the wavelength. Vector (4,nwavelength).

Type of: msediag_radia_chord:stokes (4410)

7.9.8.1.312 nbi_nbi_unit_wall

Description of the wall components in the NBI system that limits the beam spatial width of the beam. The wall is here described a superposition of surface segments and collimating holes.

member	type	description
surface	nbi_nbi_unit_wall_surface (7.9.8.1.313)	A collimating solid surface described by a polygon; no particle can pass through this surface
collimator(:)	flat_polygon (7.9.8.1.230)	Vector of collimating holes (openings). Each hole has to be flat, i.e. it lies on a surface. Particles can only cross this surface by passing through the hole. To describe the hole we first construct a coordinate system on the surface by defining the original and two basis vectors in (x,y,z) space. The polyon is then represented as the origin, plus a linear combination of the two basis vectors using coord1 and coord2. As an example, a rectangle with two of the corners given by "origin+basis1" and "origin+basis2" can be described using coord1=[1,0,-1,0] and coord2=[0,1,0,-1].

Type of: nbi_unit:wall (4417)

7.9.8.1.313 nbi_nbi_unit_wall_surface

A collimating solid surface described by a polygon; no particle can pass through this surface

member	type	description
triangle(:)	trianglexyz (7.9.8.1.494)	Triangular wall surface described by its three corners: point1, point2, and point3. Vector(n_triangles)
rectangle(:)	rectanglexyz (7.9.8.1.374)	Rectangular wall surface described by its four corners. These form an ordered sequence: point00, point01, point11, point10. Here the first point should be calculated from the other three as point00=point01+poin10-point11. Vector(n_rectangles)

Type of: nbi_nbi_unit_wall:surface (4415)

7.9.8.1.314 nbi_unit

Vector of Neutral Beam Injector units. The NBI system should be separated in to the individually power strucutres. Structure array(nunits). Time-dependent

member	type	description
name	string (7.9.8.1.4)	Name of the neutral beam injector
inj_spec	inj_spec (7.9.8.1.267)	Injected species
pow_unit	exp0D (7.9.8.1.224)	Power delivered by an NBI unit [W]; Time-dependent
inj_eng_unit	exp0D (7.9.8.1.224)	Full injection energy of a unit [ev]; Time-dependent
beamcurrfrac	exp1D (7.9.8.1.225)	Beam current fractions; beamcurrfrac(j) is the fraction of the beam current from beam neutrals with the j:th harmonic energy, inj_eng_unit. Vector(3); Time-dependent
beampowrfrac	exp1D (7.9.8.1.225)	Beam power fractions; beampowrfrac(j) is the fraction of the beam power from beam neutrals with the j:th harmonic energy, inj_eng_unit;. Vector(3); Time-dependent
beamletgroup(:)	beamletgroup (7.9.8.1.87)	Group of beamlets with common vertical and horizontal focal point. If there are no common focal points, then select small groups of beamlets such that a focal point description of the beamletgroup provides a fair description.
wall	nbi_nbi_unit_wall (7.9.8.1.312)	Description of the wall components in the NBI system that limits the beam spatial width of the beam. The wall is here described a superposition of surface segments and collimating holes.
codeparam	codeparam (7.9.8.1.105)	Code parameters

Type of: nbi:nbi_unit (4158)

7.9.8.1.315 ne_transp

Transport coefficients for electron density equation. Time-dependent.

member	type	description
diff_eff	matflt_type (7.9.8.1.15)	Effective diffusivity [m^2.s^-1]. The last index of the array describes which multiplier should be applied to the particule flux when adding its contribution in the expression of the heat flux : position 1 is multiplied by 0, 2 is multiplied by 3/2, 3 is multiplied by 5/2. The total particle flux (for the particle transport equation) is obtained as the sum over the three positions. Time-dependent. Matrix (nrho,3)
vconv_eff	matflt_type (7.9.8.1.15)	Effective convection [m.s^-1]. The last index of the array describes which multiplier should be applied to the particule flux when adding its contribution in the expression of the heat flux : position 1 is multiplied by 0, 2 is multiplied by 3/2, 3 is multiplied by 5/2. The total particle flux (for the particle transport equation) is obtained as the sum over the three positions. Time-dependent. Matrix (nrho,3)
flux	vecflt_type (7.9.8.1.18)	Flux. Not used in transport equations [field.m.s^-1,.m^-3 if field is not a density itself]. Time-dependent. Vector (nrho)
off_diagonal	offdiagel (7.9.8.1.329)	Details of the transport matrix, just for diagnostic (not used in transport equations). Time-dependent.
flag	integer (7.9.8.1.3)	Flag describing the form of transport produced by the original model : 0- not calculated, 1- D and V, 2- flux, 3- full transport matrix. Scalar.

Type of: coretransp_values:ne_transp (4260)

7.9.8.1.316 neoclassic_impurity

Array(nimp). Time-dependent

member	type	description
utheta_z	matflt_type (7.9.8.1.15)	Ion poloidal flow for various charge states [m/s]. Time-dependent. Matrix(nrho,nzimp).

Type of: neoclassic:impurity (4159)

7.9.8.1.317 neut_results

Neutronic results

member	type	description
tbr_bk	float (7.9.8.1.2)	Resulting global breeding blanket tritium breeding ratio; Scalar
tbr_bk_inb	float (7.9.8.1.2)	Resulting inboard breeding blanket Tritium Breeding Ratio [-]; Scalar
tbr_bk_outb	float (7.9.8.1.2)	Resulting outboard breeding blanket Tritium Breeding Ratio [-]; Scalar
me_bk	float (7.9.8.1.2)	Energy multiplication factor in breeding blanket; Scalar
me_shield	float (7.9.8.1.2)	Energy multiplication factor in shield; Scalar
he_appm_res	float (7.9.8.1.2)	He production in areas needing to be rewelded; Scalar
ins_dose_max	float (7.9.8.1.2)	Integral radiation dose in insulator (Epoxy) [J*Kg^-1]; Scalar
fn_flu_max	float (7.9.8.1.2)	Peak fast neutron fluence (E¿0.1 MeV) to the Nb3Sn superconductor [m^-2]; Scalar
dpa_cu_max	float (7.9.8.1.2)	Peak displacement damage to copper stabilizer [dpa]; Scalar
fn_flux_bz	float (7.9.8.1.2)	Fast neutron flux in breeding zone inboard [m^2.s^-1]; Scalar
fn_flux_bp	float (7.9.8.1.2)	Fast neutron flux in backplate inboard [m^2.s^-1]; Scalar
fn_flux_man	float (7.9.8.1.2)	Fast neutron flux in manifold inboard [m^2.s^-1]; Scalar
fn_flux_sh	float (7.9.8.1.2)	Fast neutron flux in shield inboard [m^2.s^-1]; Scalar
p_nh_bk	float (7.9.8.1.2)	Total nuclear heating in blanket [W]; Scalar
p_nh_sh	float (7.9.8.1.2)	Total nuclear heating in shield [W]; Scalar

Type of: bb_shield:neut_results (4129)

7.9.8.1.318 neutral_complex_type

Profiles derived from the fields solved in the transport equations, or from experiment. Array(nneut). Time-dependent

member	type	description
neutraltype(:)	coreneutrals_neutraltype (7.9.8.1.150)	Array (ntype) over neutral types. Time-dependent.
prad0	vecflt_type (7.9.8.1.18)	Power radiated by neutrals [W.m^-3]. Vector (nrho). Time-dependent.

Type of: coreneutrals:profiles (4136)

7.9.8.1.319 neutro_resul

Neutronic results

member	type	description
nwl_max	float (7.9.8.1.2)	Maximum neutron wall load (on equatorial outboard module) [W*m^-2]; Scalar
nwl_pol_prof	vecflt_type (7.9.8.1.18)	NWL scaling factor coefficient for each bb module; Vector(nmodules)

Type of: bb:neutro_resul (4186)

7.9.8.1.320 ni_transp

Transport coefficients for ion density equation. Time-dependent.

member	type	description
diff_eff	array3dflt_type (7.9.8.1.7)	Effective diffusivity [m^2.s^-1]. The last index of the array describes which multiplier should be applied to the particule flux when adding its contribution in the expression of the heat flux : position 1 is multiplied by 0, 2 is multiplied by 3/2, 3 is multiplied by 5/2. The total particle flux (for the particle transport equation) is obtained as the sum over the three positions. Time-dependent. Array3d (nrho,nion,3)
vconv_eff	array3dflt_type (7.9.8.1.7)	Effective convection [m.s^-1]. The last index of the array describes which multiplier should be applied to the particule flux when adding its contribution in the expression of the heat flux : position 1 is multiplied by 0, 2 is multiplied by 3/2, 3 is multiplied by 5/2. The total particle flux (for the particle transport equation) is obtained as the sum over the three positions. Time-dependent. Array3d (nrho,nion,3)
flux	matflt_type (7.9.8.1.15)	Flux. Not used in transport equations [field.m.s^-1,.m^-3 if field is not a density itself]. Time-dependent. Matrix (nrho,nion)
off_diagonal	offdiagion (7.9.8.1.330)	Details of the transport matrix, just for diagnostic (not used in transport equations). Time-dependent.
flag	integer (7.9.8.1.3)	Flag describing the form of transport produced by the original model : 0- not calculated, 1- D and V, 2- flux, 3- full transport matrix. Scalar.

Type of: coretransp_values:ni_transp (4260)

7.9.8.1.321 ntm_mode

List of the various NTM modes appearing during the simulation. If a mode appears several times, use several indices in this arra of structure with the same m,n values. All descendant nodes are marked as Time-dependent for technical reasons, to allow the size of the mode AoS to vary.

member	type	description
m	integer (7.9.8.1.3)	Poloidal mode number. Time-dependent.
n	integer (7.9.8.1.3)	Toroidal mode number. Time-dependent.
onset(:)	ntm_mode_onset (7.9.8.1.326)	NTM onset characteristics. Array of structure(nevent). Time-dependent
full_evol(:)	ntm_mode_full_evol (7.9.8.1.324)	Detailed NTM evolution on a finer timebase than the CPO timebase. Array of structure(nevent). Time-dependent.
evolution	ntm_mode_evolution (7.9.8.1.322)	NTM evolution corresponding to the CPO timebase. Time-dependent.

Type of: ntm:mode (4160)

7.9.8.1.322 ntm_mode_evolution

NTM evolution corresponding to the CPO timebase. Time-dependent.

member	type	description
w	float (7.9.8.1.2)	Full width of the mode [m]. Time-dependent.
dwdt	float (7.9.8.1.2)	Time derivative of the full width of the mode [m/s]. Time-dependent.
phase	float (7.9.8.1.2)	Phase of the mode [rad]. Time-dependent.
dphasedt	float (7.9.8.1.2)	Time-derivative of the phase of the mode [rad]. Time-dependent.
frequency	float (7.9.8.1.2)	Frequency of the mode [Hz]. Time-dependent.
dfrequencydt	float (7.9.8.1.2)	Time derivative of the frequency of the mode [Hz]. Time-dependent.
island	ntm_mode_evolution_island (7.9.8.1.323)	Island description

member	type	description
deltaw_value	vecflt_type (7.9.8.1.18)	Vector(ntype). Time-dependent.
deltaw_name	vecstring_type (7.9.8.1.20)	Name of the deltaw contribution. String vector (ntype). Time-dependent.
torque_value	vecflt_type (7.9.8.1.18)	Vector(ntype_torque). Time-dependent.
torque_name	vecstring_type (7.9.8.1.20)	Name of the torque contribution. String vector (ntype). Time-dependent.
delta_diff	vecflt_type (7.9.8.1.18)	Extra diffusion coefficient for Te, ne, Ti equation. Vector(nequation). Time-dependent.
description	string (7.9.8.1.4)	How the mode evolution is calculated. Time-dependent.
rho_tor	float (7.9.8.1.2)	[m]. Time-dependent.

Type of: ntm_mode:evolution (4424)

7.9.8.1.323 ntm_mode_evolution_island

Island description

member	type	description
geometry	vecflt_type (7.9.8.1.18)	Description of island geometry [?]. Vector(nradial). Time-dependent.
coord_values	vecflt_type (7.9.8.1.18)	Radial coordinate values [?]. Vector(nradial). Time-dependent.
coord_desc	string (7.9.8.1.4)	Description of flux label, use the same for all islands. Time-dependent.

Type of: ntm_mode_evolution:island (4425)

7.9.8.1.324 ntm_mode_full_evol

Detailed NTM evolution on a finer timebase than the CPO timebase. Time-dependent.

member	type	description
time_evol	vecflt_type (7.9.8.1.18)	Time array used to describe the detailed mode evolution which can be different from the CPO timebase [s]. Vector(ntime_evol). Time-dependent.
w	vecflt_type (7.9.8.1.18)	Full width of the mode [m]. Vector(ntime_evol). Time-dependent.
dwdt	vecflt_type (7.9.8.1.18)	Time derivative of the full width of the mode [m/s]. Vector(ntime_evol). Time-dependent.
phase	vecflt_type (7.9.8.1.18)	Phase of the mode [rad]. Vector(ntime_evol). Time-dependent.
dphasedt	vecflt_type (7.9.8.1.18)	Time-derivative of the phase of the mode [rad]. Vector(ntime_evol). Time-dependent.
frequency	vecflt_type (7.9.8.1.18)	Frequency of the mode [Hz]. Vector(ntime_evol). Time-dependent.
dfrequencydt	vecflt_type (7.9.8.1.18)	time derivative of the frequency of the mode [Hz]. Vector(ntime_evol). Time-dependent.
island	ntm_mode_full_evol_island (7.9.8.1.325)	Island description
deltaw_value	matflt_type (7.9.8.1.15)	Matrix(ntype, ntime_evol). Time-dependent.
deltaw_name	vecstring_type (7.9.8.1.20)	Name of the deltaw contribution. String vector (ntype). Time-dependent.
torque_value	matflt_type (7.9.8.1.15)	Matrix(ntype_torque, ntime_evol). Time-dependent.
torque_name	vecstring_type (7.9.8.1.20)	Name of the torque contribution. String vector (ntype_torque). Time-dependent.
delta_diff	matflt_type (7.9.8.1.15)	Extra diffusion coefficient for Te, ne, Ti equation. Matrix(nequation, ntime_evol). Time-dependent.
description	string (7.9.8.1.4)	How the mode evolution is calculated. Time-dependent.
rho_tor	vecflt_type (7.9.8.1.18)	[m]. Vector(ntime_evol) Time-dependent.

Type of: ntm_mode:full_evol (4424)

7.9.8.1.325 ntm_mode_full_evol_island

Island description

member	type	description
geometry	matflt_type (7.9.8.1.15)	Description of island geometry [?]. Matrix(nradial, ntime_evol). Time-dependent.
coord_values	matflt_type (7.9.8.1.15)	Radial coordinate values [?]. Matrix(nradial, ntime_evol). Time-dependent.
coord_desc	string (7.9.8.1.4)	Description of flux label, use the same for all islands. Time-dependent.

Type of: ntm_mode_full_evol:island (4427)

7.9.8.1.326 ntm_mode_onset

NTM onset characteristics. Time-dependent

member	type	description
w_seed	float (7.9.8.1.2)	Seed island full width [m]. Time-dependent.
time_onset	float (7.9.8.1.2)	Onset time [s]. Time-dependent.
time_offset	float (7.9.8.1.2)	Offset time [s] (when a mode disappears). If the mode reappears later in the simulation, use another index of the mode array of structure. Time-dependent.
phase	float (7.9.8.1.2)	Phase of the mode at onset [rad]. Time-dependent.
description	string (7.9.8.1.4)	Cause of the mode onset. Time-dependent.

Type of: ntm_mode:onset (4424)

7.9.8.1.327 nuclei

Array of nuclei considered.

member	type	description
zn	float (7.9.8.1.2)	Nuclear charge [units of elementary charge];
amn	float (7.9.8.1.2)	Mass of atom [amu]
label	string (7.9.8.1.4)	String identifying element (e.g. H, D, T, He, C, ...)

Type of: compositions_type:nuclei (4230)

7.9.8.1.328 objects

Definition of space objects (nodes, edges, faces, cells, ...).; A space object of dimension n is defined; by enumerating the (n-1)-dimensional space objects defining its boundaries

member	type	description
boundary	matint_type (7.9.8.1.16)	Lists of (n-1)-dimensional space objects defining the boundary of an n-dimensional space object.; Matrix(number of objects of dimension n, maximum number of boundary objects).; First dimension: object index, second dimension: boundary object index
neighbour	array3dint_type (7.9.8.1.8)	Connectivity information. Array (number of objects, maximum number of boundaries per object, maximum number of neighbours per boundary).; Stores the indices of the n-dimensional objects adjacent to the given n-dimensional object.;An object can possibly have multiple neighbours on every boundary.; First dimension: object index, second dimension: boundary index, third dimension: neighbour index on the boundary.
geo	array4dflt_type (7.9.8.1.9)	Geometry data matrix associated with every object. Float array (number of objects, number of geometry coeff. 1, number of geometry coeff. 2, number of geometries).; The exact definition depends on the geometry type of the space (complexgrid_space.geotype).; First dimension: object index, second+third dimension: geometry coefficient matrix row+column, third dimension: geometry index (for definition of multiple geometries).
measure	matflt_type (7.9.8.1.15)	Measure of space objects, i.e. physical size (length for 1d, area for 2d, volume for 3d objects,...). [m^dim].; First dimension: object index, second dimension: geometry index

Type of: complexgrid_space:objects (4222)

7.9.8.1.329 offdiagel

Subtree containing the full transport matrix from a transport model, for the electrons. Time-dependent.

member	type	description
d_ni	matflt_type (7.9.8.1.15)	Off-Diagonal term coupling ion density gradient to the transport equation [m.^2.s^-1]. Time-dependent. Matrix (nrho,nion)
d_ti	matflt_type (7.9.8.1.15)	Off-Diagonal term coupling ion density gradient to the transport equation [m.^2.s^-1]. Time-dependent. Matrix (nrho,nion)
d_ne	vecflt_type (7.9.8.1.18)	Off-Diagonal term coupling electron density gradient to the transport equation [m.^2.s^-1]. Time-dependent. Vector (nrho)
d_te	vecflt_type (7.9.8.1.18)	Off-Diagonal term coupling electron temperature gradient to the transport equation [m.^2.s^-1]. Time-dependent. Vector (nrho)
d_epar	vecflt_type (7.9.8.1.18)	Off-Diagonal term coupling parallel electric field to the transport equation [m.^2.s^-1]. Time-dependent. Vector (nrho)
d_mtor	vecflt_type (7.9.8.1.18)	Off-Diagonal term coupling total toroidal momentum to the transport equation [m.^2.s^-1]. Time-dependent. Vector (nrho)

Type of: ne_transp:off_diagonal (4418) I transcoefel:off_diagonal (4592)

7.9.8.1.330 offdiagion

Subtree containing the full transport matrix from a transport model, for the various ion species

member	type	description
d_ni	array3dflt_type (7.9.8.1.7)	Off-Diagonal term coupling ion density gradient to the transport equation [m.^2.s^-1]. Time-dependent. Array3d (nrho,nion,nion)
d_ti	array3dflt_type (7.9.8.1.7)	Off-Diagonal term coupling ion density gradient to the transport equation [m.^2.s^-1]. Time-dependent. Array3d (nrho,nion,nion)
d_ne	matflt_type (7.9.8.1.15)	Off-Diagonal term coupling electron density gradient to the transport equation [m.^2.s^-1]. Time-dependent. Matrix (nrho,nion)
d_te	matflt_type (7.9.8.1.15)	Off-Diagonal term coupling electron temperature gradient to the transport equation [m.^2.s^-1]. Time-dependent. Matrix (nrho,nion)
d_epar	matflt_type (7.9.8.1.15)	Off-Diagonal term coupling parallel electric field to the transport equation [m.^2.s^-1]. Time-dependent. Matrix (nrho,nion)
d_mtor	matflt_type (7.9.8.1.15)	Off-Diagonal term coupling total toroidal momentum to the transport equation [m.^2.s^-1]. Time-dependent. Matrix (nrho,nion)

Type of: ni_transp:off_diagonal (4423) I transcoefion:off_diagonal (4594) I transcoefvtor:off_diagonal (4595)

7.9.8.1.331 omnigen_surf

List of omnigeuous magnetic surfaces to which the s-coordinates in grid_coord refer. NOTE: only used for gridcoord=3. NOTE: all guiding centre orbits intersect at least one omnigeuous (or stagnation) surfaces, i.e. the omnigeuous generalised the equitorial plane (the midplane). nsurfs=Number of omnigenous surfaces. Structure array(nregion_topo)

member	type	description
rz	rz1D (7.9.8.1.387)	(R,z) coordinates of the omnigeuous magnetic surfaces (generalised equitorial plane). NOTE: only used for gridcoord=3. Vector rz1d (nsurfs)
s	vecflt_type (7.9.8.1.18)	Coordinates which uniquely maps the omnigeuous magnetic surfaces (generalised equitorial plane). NOTE: only used for gridcoord=3. Vector (nsurfs)

Type of: dist_grid_info:omnigen_surf (4283)

7.9.8.1.332 orbit_global_param

Global quantities associated with an orbit.

member	type	description
orbit_type	vecint_type (7.9.8.1.19)	Identifier of orbit type: 0 trapped, -1 co-passing, + 1 counter-passing ; Time-dependent; Vector (norbits)
omega_b	vecflt_type (7.9.8.1.18)	Bounce angular frequency rad/s; Time-dependent; Vector (norbits)
omega_phi	vecflt_type (7.9.8.1.18)	Toroidal angular precession frequency [rad/s]; Time-dependent; Vector (norbits).
omega_c_av	vecflt_type (7.9.8.1.18)	Orbit averaged cyclotron frequency [rad/a]; Time-dependent; Vector(norbits).
special_pos	orbit_special_pos (7.9.8.1.335)	Special positions along an orbit (like turning points).

Type of: orbit:global_param (4161)

7.9.8.1.333 orbit_midplane

Intersections with the midplane

member	type	description
outer	orbit_pos (7.9.8.1.334)	Position at outer mid-plane
inner	orbit_pos (7.9.8.1.334)	Position at inner mid-plane

Type of: orbit_special_pos:midplane (4438)

7.9.8.1.334 orbit_pos

Complex type for orbit position (Vector)

member	type	description
r	vecflt_type (7.9.8.1.18)	Major radius [m]; Time-dependent; Vector (norbits).
z	vecflt_type (7.9.8.1.18)	Altitude [m]; Time-dependent; Vector (norbits).
phi	vecflt_type (7.9.8.1.18)	Toroidal angle [rad]; Time-dependent; Vector (norbits).
psi	vecflt_type (7.9.8.1.18)	Position in psi [normalised poloidal flux]; Time-dependent; Vector (norbits).
theta_b	vecflt_type (7.9.8.1.18)	Poloidal Boozer angle [rad]; Time-dependent; Vector (norbits).

Type of: orbit_midplane:inner (4436) I orbit_midplane:outer (4436) I orbit_turning_pts:lower (4439) I orbit_turning_pts:upper (4439)

7.9.8.1.335 orbit_special_pos

Special positions along an orbit (like turning points).

member	type	description
midplane	orbit_midplane (7.9.8.1.333)	Intersections with the midplane
turning_pts	orbit_turning_pts (7.9.8.1.336)	Location of turning points

Type of: orbit_global_param:special_pos (4435)

7.9.8.1.336 orbit_turning_pts

Location of turning points

member	type	description
upper	orbit_pos (7.9.8.1.334)	Position at upper turning point
lower	orbit_pos (7.9.8.1.334)	Position at lower turning point

Type of: orbit_special_pos:turning_pts (4438)

7.9.8.1.337 origin

member	type	description
refpos	rzphi0D (7.9.8.1.392)	Reference point of the local coordinate system; the position of either the last quasi-optical element, or the horn antenna. Default is facing horizontally away from the central axis. The local coordinate system is cartesian, with the local z axis defining the nominal beam direction, x parallel to the global z, and y completing the right-handed local coordinate system
alpha	float (7.9.8.1.2)	Poloidal tilt angle [rad]; angle between local z axis and horizontal plane, 0 is facing outward, pi/2 is downwards, pi inwards
beta	float (7.9.8.1.2)	Toroidal tilt angle [rad]; angle between local z axis and r-z plane
gamma	float (7.9.8.1.2)	Rotation angle about local z axis [rad]

Type of: reflectometry_antennas:origin (4481)

7.9.8.1.338 param

Code parameters block passed from the wrapper to the subroutine. Does not appear as such in the data structure (in fact each string is an instance of codeparam/parameters). This is inserted in utilities.xsd for automatic declaration in the Fortran type definitions.

member	type	description
parameters	string (7.9.8.1.4)	Actual value of the code parameters (instance of coparam/parameters in XML format).
default_param	string (7.9.8.1.4)	Default value of the code parameters (instance of coparam/parameters in XML format).
schema	string (7.9.8.1.4)	Code parameters schema.

Type of

7.9.8.1.339 parameters

Parameters used to defined the grid coordiantes. Time-dependent

member	type	description
equatorial	equatorial_plane (7.9.8.1.221)	Description of the equatorial plane or any other omnigeuous surfaces. Time-dependent

Type of: source_rate:parameters (4536)

7.9.8.1.340 pellet

Description of the pellets entering the plasma at given time. Array of structures (NPEL). Time-dependent.

member	type	description
shape	pellet_shape (7.9.8.1.347)	Structure defining the shape of the pellet. Time-dependent.
elements	pellet_elements (7.9.8.1.343)	Structure defining the composition of the pellet. Time-dependent.
geometry	pellet_geometry (7.9.8.1.344)	Structure describing the geometry of the pellet path. Time-dependent.
pathprofiles	pellet_pathprofiles (7.9.8.1.346)	Structure describing 1-D profiles of plasma and pellet along the pellet path. Time-dependent.
deposition	pellet_deposition (7.9.8.1.342)	Structure defining the pellet action on the plasma (along rho_tor). Time-dependent.

Type of: pellets:pellet (4162)

7.9.8.1.341 pellet_angles

Angles of the pellet trajectory. Time-dependent.

member	type	description
horizontal	float (7.9.8.1.2)	Angle [rad] of the horizontal projection of the path with poloidal cross section (0 for HFS , then counter clockwise looking from above), scalar. Time-dependent.
vertical	float (7.9.8.1.2)	Angle [rad] of the path with vertical axis section (0 for bottom-top trajectory, then counter clockwise), scalar. Time-dependent.

Type of: pellet_geometry:angles (4447)

7.9.8.1.342 pellet_deposition

Structure defining the pellet action on the plasma (along rho_tor). Time-dependent.

member	type	description
rho_tor	vecflt_type (7.9.8.1.18)	Toroidal flux coordinate [m], array (NRHO). Time-dependent.
rho_pol	vecflt_type (7.9.8.1.18)	Poloidal flux coordinate [m], array(NRHO). Time-dependent.
delta_ne	vecflt_type (7.9.8.1.18)	Instant change of ne profile due to pellet ablation [m^-3], array(NRHO). Time-dependent.
delta_te	vecflt_type (7.9.8.1.18)	Instant change of Te profile due to pellet ablation [eV], array(NRHO). Time-dependent.
delta_ni	matflt_type (7.9.8.1.15)	Instant change of ni profile due to pellet ablation [m^-3], array (NRHO, NION). Time-dependent.
delta_ti	matflt_type (7.9.8.1.15)	Instant change of Ti profile due to pellet ablation [eV], array (NRHO, NION). Time-dependent.
delta_vtor	matflt_type (7.9.8.1.15)	Instant change of Vtor profile due to pellet ablation [m/s], array (NRHO, NION). Time-dependent.
impurity(:)	pellet_impurity (7.9.8.1.345)	Contributions to impurity array of structures (NIMP). Time-dependent

Type of: pellet:deposition (4443)

7.9.8.1.343 pellet_elements

Structure defining the composition of the pellet. Time-dependent.

member	type	description
nucindex	vecint_type (7.9.8.1.19)	Index into list of nuclei, array over elements in pellet (NATM). Time-dependent.
density	vecflt_type (7.9.8.1.18)	Material density of each element of the pellet, array over elements (NATM). Time-dependent.

member	type	description
fraction	vecflt_type (7.9.8.1.18)	Fraction of each element in the pellet, array over elements in pellet (NATM). Time-dependent.
subl_energy	vecflt_type (7.9.8.1.18)	Sublimation energy per atom, array over elements in pellet (NATM). Time-dependent.

Type of: pellet:elements (4443)

7.9.8.1.344 pellet_geometry

Structure describing the geometry of the pellet path. Time-dependent.

member	type	description
pivot_point	rzphi0D (7.9.8.1.392)	Coordinates of the pivot point for pellet trajectory. Time-dependent.
second_point	rzphi0D (7.9.8.1.392)	Coordinates of the second point for pellet trajectory. Time-dependent.
velocity	float (7.9.8.1.2)	Starting velocity of the pellet [m/s]. Scalar. Time-dependent.
angles	pellet_angles (7.9.8.1.341)	Angles of the pellet trajectory. Time-dependent.

Type of: pellet:geometry (4443)

7.9.8.1.345 pellet_impurity

Contributions to impurity array of structures (NIMP). Time-dependent

member	type	description
delta_nz	matflt_type (7.9.8.1.15)	Instant change of Nz profile (per charge state) due to pellet ablation [m^-3], array (NRHO, NZ-IMP). Time-dependent.

Type of: pellet_deposition:impurity (4445)

7.9.8.1.346 pellet_pathprofiles

Structure describing 1-D profiles of plasma and pellet along the pellet path. Time-dependent.

member	type	description
distance	vecflt_type (7.9.8.1.18)	Coordinate along the pellet trajectory [m], array (NPATH). Time-dependent.
rho_tor	vecflt_type (7.9.8.1.18)	Toroidal flux coordinate along the pellet trajectory [m], array (NPATH). Time-dependent.
rho_pol	vecflt_type (7.9.8.1.18)	Poloidal flux coordinate along the pellet trajectory [m], array (NPATH). Time-dependent.
velocity	vecflt_type (7.9.8.1.18)	Pellet velocity along the pellet trajectory [m/s], array (NPATH). Time-dependent.
ne	vecflt_type (7.9.8.1.18)	Electron density along the pellet trajectory [m^-3], array (NPATH). Time-dependent.
te	vecflt_type (7.9.8.1.18)	Electron temperature along the pellet trajectory [eV], array (NPATH). Time-dependent.
abl_rate	vecflt_type (7.9.8.1.18)	Ablation rate along the pellet trajectory [part/s], array (NPATH). Time-dependent.
abl_particles	vecflt_type (7.9.8.1.18)	Number of ablated particles along the pellet trajectory [part], array (NPATH). Time-dependent.
delta_drift	vecflt_type (7.9.8.1.18)	Radial displacement due to ExB drifts along the pellet trajectory [m], array (NPATH). Time-dependent.
position	rzphi1D (7.9.8.1.393)	Coordinates of the pellet trajectory line, array (NPATH). Time-dependent.

Type of: pellet:pathprofiles (4443)

7.9.8.1.347 pellet_shape

Structure defining the shape of the pellet. Time-dependent.

member	type	description
type	identifier (7.9.8.1.263)	Identifier for the shape of the pellet: 1-spherical; 2-cylindrical; 3-rectangular; 4-generic. Time-dependent.
dimensions	vecflt_type (7.9.8.1.18)	Vector specifying the dimensions of the pellet following the order for predefined shapes. Spherical pellets: dimensions(1) is the radius [m] of the pellet; Cylindrical pellets: dimensions(1) is the radius [m] and dimensions(2) is the height [m] of the cylinder; Rectangular pellets: dimensions(1) is the height [m], dimensions(2) is the width [m] and dimensions(3) is the length [m]; Time-dependent.

Type of: pellet:shape (4443)

7.9.8.1.348 permeability

Permeability model (can be different for each iron segment)

member	type	description
b	matflt_type (7.9.8.1.15)	List of B values for description of the mur(B) dependence [T]; Matrix (nsegment,nB)
mur	matflt_type (7.9.8.1.15)	Relative permeability mur(B) [dimensionless]; Matrix (nsegment,nB)

Type of: desc_iron:permeability (4268)

7.9.8.1.349 pfcircuits

Circuits, connected to multiple coils and to multiple supplies, defining the current and voltage relationships in the system

member	type	description
name	vecstring_type (7.9.8.1.20)	Name of circuit, array of strings (ncircuits)
id	vecstring_type (7.9.8.1.20)	ID of circuit, array of strings (ncircuits)
type	vecstring_type (7.9.8.1.20)	Type of circuit, array of strings (ncircuits)
nnodes	vecint_type (7.9.8.1.19)	Number of nodes used to describe a circuit. Vector (ncircuits)
connections	array3dint_type (7.9.8.1.8)	Description of the supplies and coils connections (nodes) across each circuit. Array 3D (ncircuits,max_nnodes,2*ncomponents), describing for each node which component are connected to it (1 if connected, 0 otherwise). There are 2 sides at each component, thus 2*ncomponents as the size of the third dimension, listing first all supplies, then all coils (in the same order as listed in PFSUPPLIES and PFCOILS). An example can be found in the data structure documentation PFconnections.pdf

Type of: pfsystems:pfcircuits (4163)

7.9.8.1.350 pfcoils

Active poloidal field coils

member	type	description
desc_pfcoils	desc_pfcoils (7.9.8.1.166)	Description of the coils
coilcurrent	exp1D (7.9.8.1.225)	Circuit feed current in the coil, defined positive if it flows from point 1 to point 2 of the component in the pfcircuit description [A]; Time-dependent; Vector (ncoils)
coilvoltage	exp1D (7.9.8.1.225)	Voltage on the full coil [V]; Time-dependent; Vector (ncoils)
p_cryo	float (7.9.8.1.2)	Total electric power consumed by the cryoplant system [W]; Time-dependent. Scalar.
p_nh	vecflt_type (7.9.8.1.18)	Nuclear heating on the poloidal field coils [W]; Time-dependent. Vector(ncoils)

Type of: pfsystems:pfcoils (4163)

7.9.8.1.351 pfelement

Axisymmetric conductor description

member	type	description
name	vecstring_type (7.9.8.1.20)	Name of this element. Should be a matrix of strings (ncoils,max_nelements), but not supported by the UAL yet.
id	vecstring_type (7.9.8.1.20)	ID of this element. Should be a matrix of strings (ncoils,max_nelements), but not supported by the UAL yet.
turnsign	matflt_type (7.9.8.1.15)	Sign of turn and fraction of a turn for calculating magnetic field of the Element; Matrix (ncoils,max_nelements)
area	matflt_type (7.9.8.1.15)	Surface area of this element [m^2]; Matrix (ncoils,max_nelements)
pfgeometry	pfgeometry (7.9.8.1.352)	Shape of a PF Coil Element

Type of: desc_pfcoils:pfelement (4269)

7.9.8.1.352 pfgeometry

Shape of a PF Coil Element

member	type	description
type	matint_type (7.9.8.1.16)	Type used to describe a coil shape (0 for 'rzcoordinates' or 1 for 'rzdrdz'); Matrix of integers (ncoils,max_nelements)
npoints	matint_type (7.9.8.1.16)	Number of points describing an element (irregular outline rzcoordinates); Matrix (ncoils,max_nelements)
rzcoordinate	rz3D (7.9.8.1.391)	Irregular outline [m]; 3D arrays (ncoils,max_nelements,max_npoints)
rzdrdz	array3dflt_type (7.9.8.1.7)	4-vector defining Centre R,Z and full extents dR, dZ [m]; 3D Array (ncoils,max_nelements,4)

Type of: pfelement:pfgeometry (4454)

7.9.8.1.353 pfpageometry

Geometry of the passive elements

member	type	description
type	vecint_type (7.9.8.1.19)	Type used to describe the shape (0 for 'rzcoordinates' or 1 for 'rzdrdz'); Vector of integers (nelements)
npoints	vecint_type (7.9.8.1.19)	Number of points describing an element (irregular outline rzcoordinates); Vector of integers (nelements)
rzcoordinate	rz2D (7.9.8.1.390)	Irregular outline [m]; Matrix (nelements,max_npoints)
rzdrdz	matflt_type (7.9.8.1.15)	4-vector defining Centre R,Z and full extents dR, dZ [m]; Matrix (nelements,4)

Type of: pfpassive:pfpageometry (4457)

7.9.8.1.354 pfpassive

Passive axisymmetric conductor description

member	type	description
name	vecstring_type (7.9.8.1.20)	Name of coil. Array of strings (nelements)
area	vecflt_type (7.9.8.1.18)	Surface area of this passive element [m^2]; Vector (nelements)
res	vecflt_type (7.9.8.1.18)	Passive element resistance [Ohm]; Vector (nelements)
eta	vecflt_type (7.9.8.1.18)	Passive element resistivity [Ohm.m]; Vector (nelements)
current	pfpassive_current (7.9.8.1.355)	Current induced in passive structures.
pfpageometry	pfpageometry (7.9.8.1.353)	Geometry of the passive elements

Type of: pfsystems:pfpassive (4163)

7.9.8.1.355 pfpassive_current

Current induced in passive structures.

member	type	description
toroidal	exp1D (7.9.8.1.225)	Toroidal current induced in passive structures [A]. Vector (nelements); Time-dependent
poloidal	exp1D (7.9.8.1.225)	Poloidal current induced in passive structures [A]. Vector (nelements); Time-dependent

Type of: pfpassive:current (4457)

7.9.8.1.356 pfsupplies

PF power supplies

member	type	description
desc_supply	desc_supply (7.9.8.1.167)	Description of the power supplies
voltage	exp1D (7.9.8.1.225)	Voltage at the supply output [V]; Time-dependent; Vector (nsupplies)
current	exp1D (7.9.8.1.225)	Current at the supply output, defined positive if it flows from point 1 to point 2 of the component in the pfcircuit description [A]; Time-dependent; Vector (nsupplies)

Type of: pfsystems:pfsupplies (4163)

7.9.8.1.357 phaseellipse

Phase ellipse characteristics

member	type	description
invcurvrad	vecflt_type (7.9.8.1.18)	Inverse curvature radii for the phase ellipse [m-1], positive/negative for divergent/convergent beams, Vector (2). Time-dependent
angle	float (7.9.8.1.2)	Rotation angle for the phase ellipse [rd], Float. Time-dependent

Type of: rfbeam:phaseellipse (4488)

7.9.8.1.358 planecoil

Plane coil description

member	type	description
coordinates	rz1D (7.9.8.1.387)	Coordinate points of centre of conductor; vectors(nelements)
hlength	vecflt_type (7.9.8.1.18)	Half length perpendicular to plane where coil is defined; vector(nelements) [m].
radialhwidth	vecflt_type (7.9.8.1.18)	Half width, (outer contour-inner contour)/2; vector(nelements) [m].

Type of: tf_desc_tfcoils:planecoil (4585)

7.9.8.1.359 plasmaComplexType

Description of incoming plasma

member	type	description
species	vecint_type (7.9.8.1.19)	Definition of plasma species. Index into wall/compositions/edgespecies. Integer vector (number of plasma species).
flux	matflt_type (7.9.8.1.15)	Plasma particle flux density from/to plasma facing wall surfaces [1/(m^2 s)]. Positive means incoming onto the wall, negative means sent back into the plasma. Time-dependent; Float matrix (number of plasma species, number of discretization elements in the subgrid)
b	matflt_type (7.9.8.1.15)	Magnetic field vector at the surface [T]; Time-dependent; Float matrix (number of space dimensions, number of discretization elements in the subgrid). If two-dimensional: unit vectors with first coordinate perpendicular to the wall facing towards the plasma, second coordinate parallel to the surface (in the direction of the surface discretization), third dimension is zero. If three-dimensional: vector is relative to basis vectors stored in wall/wall3d/grid/basis with basis index as given in wall/wall3d/basis_index.
energy	matflt_type (7.9.8.1.15)	Total energy flux density of incoming particles of given species [W/m^2]; Positive means incoming onto the wall, negative means sent back into the plasma. Time-dependent; Float matrix (number of plasma species, number of discretization elements in the subgrid)

Type of: wall2d:plasma (4612) I wall3d:plasma (4614)

7.9.8.1.360 plasmaedge

Plasma edge characteristics in front of the antenna.

member	type	description
npoints	integer (7.9.8.1.3)	Number of points in the distance grid. Integer
distance	vecflt_type (7.9.8.1.18)	Grid for electron density, defined as the perpendicular distance to the antenna waveguide plane (the origin being described in the position sub-structure) [m]. Vector (npoints). Time-dependent.
density	vecflt_type (7.9.8.1.18)	Electron density in front of the antenna [m^-3]. Vector (npoints). Time-dependent.

Type of: antenna_lh:plasmaedge (4182)

7.9.8.1.361 pol_decomp

TO BE REMOVED, being replaced by e_components and grid. Kept only to make smooth transition between data-type versions. [Poloidal decomposition of the wave fields. Uses the flux surface grid in grid_1d.]

member	type	description
mpol	vecint_type (7.9.8.1.19)	Poloidal mode numbers; Vector (nmpol)
e_plus	array3dflt_type (7.9.8.1.7)	Magnitude of poloidal Fourier decomposition of left hand polarised component of the wave electric field [V/m]; Time-dependent; Array 3D (ntor, npsi, nmpol)

member	type	description
e_plus_ph	array3dflt_type (7.9.8.1.7)	Phase of poloidal Fourier decomposition of left hand polarised component of the wave electric field [rad]; Time-dependent; Array 3D (ntor, npsi, nmpol)
e_minus	array3dflt_type (7.9.8.1.7)	Magnitude of poloidal Fourier decomposition of right hand polarised component of the wave electric field; Time-dependent (V/m); Array 3D (ntor, npsi, nmpol)
e_minus_ph	array3dflt_type (7.9.8.1.7)	Phase of poloidal Fourier decomposition of right hand polarised component of the wave electric field [rad]; Time-dependent; Array 3D (ntor, npsi, nmpol)
e_norm	array3dflt_type (7.9.8.1.7)	Magnitude of poloidal Fourier decomposition of wave electric field normal to a flux surface [V/m]; Time-dependent; Array 3D (ntor, npsi, nmpol)
e_norm_ph	array3dflt_type (7.9.8.1.7)	Phase of poloidal Fourier decomposition of wave electric field normal to a flux surface [rad]; Time-dependent; Array 3D (ntor, npsi, nmpol)
e_binorm	array3dflt_type (7.9.8.1.7)	Magnitude of poloidal Fourier decomposition of wave electric field tangent to a flux surface [V/m]; Time-dependent; Array 3D (ntor, npsi, nmpol)
e_binorm_ph	array3dflt_type (7.9.8.1.7)	Phase of poloidal Fourier decomposition of wave electric field tangent to a flux surface [rad]; Time-dependent; Array 3D (ntor, npsi, nmpol)
e_para	array3dflt_type (7.9.8.1.7)	Magnitude of poloidal Fourier decomposition of parallel wave electric field [V/m]; Time-dependent; Array 3D (ntor, npsi, nmpol)
e_para_ph	array3dflt_type (7.9.8.1.7)	Phase of poloidal Fourier decomposition of parallel wave electric field [rad]; Time-dependent; Array 3D (ntor, npsi, nmpol)
b_norm	array3dflt_type (7.9.8.1.7)	Magnitude of poloidal Fourier decomposition of wave magnetic field normal to a flux surface [T]; Time-dependent; Array 3D (ntor, npsi, nmpol)
b_norm_ph	array3dflt_type (7.9.8.1.7)	Phase of poloidal Fourier decomposition of normal wave magnetic field [rad]; Time-dependent; Array 3D (ntor, npsi, nmpol)
b_binorm	array3dflt_type (7.9.8.1.7)	Magnitude of poloidal Fourier decomposition of wave magnetic field tangent to a flux surface [T]; Time-dependent; Array 3D (ntor, npsi, nmpol)
b_binorm_ph	array3dflt_type (7.9.8.1.7)	Phase of poloidal Fourier decomposition of wave magnetic field tangent to a flux surface [rad]; Time-dependent; Array 3D (ntor, npsi, nmpol)
b_para	array3dflt_type (7.9.8.1.7)	Magnitude of Fourier decomposition of wave magnetic field parallel to the equilibrium magnetic field [T]; Time-dependent; Array 3D (ntor, npsi, nmpol)
b_para_ph	array3dflt_type (7.9.8.1.7)	Phase of Fourier decomposition of wave magnetic field parallel to the equilibrium magnetic field [T]; Time-dependent; Array 3D (ntor, npsi, nmpol)
k_perp	array3dflt_type (7.9.8.1.7)	Perpendicular wave number [T]; Time-dependent; Array 3D (ntor, npsi, nmpol)

Type of: fullwave:pol_decomp (4340)

7.9.8.1.362 polarimetry

This structure accomodates the polarimetry setup and measurements of a mse diagnostic, as widely used in fusion devices. The final measurement is the tan(gamma) where gamma is the polarization angle of a particular spectral mse component.

member	type	description
setup	msediag_setup_polarimetry (7.9.8.1.310)	diagnostic setup information
measure	exp1D (7.9.8.1.225)	Measured value (MSE angle gamma [rad]). Time-dependent; Vector (nchords)

Type of: msediag:polarimetry (4157)

7.9.8.1.363 polarization

Wave field polarization along the ray/beam.

member	type	description
epol_p_re	vecflt_type (7.9.8.1.18)	Real part of the left hand polarized electric field (rotating with the ions), Vector (npoints). Time-dependent
epol_p_im	vecflt_type (7.9.8.1.18)	Imaginary part of the left hand polarized electric field (rotating with the ions), Vector (npoints). Time-dependent
epol_m_re	vecflt_type (7.9.8.1.18)	Real part of the right hand polarized electric field (rotating with the electrons), Vector (npoints). Time-dependent
epol_m_im	vecflt_type (7.9.8.1.18)	Real part of the right hand polarized electric field (rotating with the electrons), Vector (npoints). Time-dependent
epol_par_re	vecflt_type (7.9.8.1.18)	Real part of the electric field polarization vector in the magnetic field direction, Vector (npoints). Time-dependent
epol_par_im	vecflt_type (7.9.8.1.18)	Imaginary part of the electric field polarization vector in the magnetic field direction, Vector (npoints). Time-dependent

Type of: beamtracing:polarization (4192)

7.9.8.1.364 power_conv_component

Description of the components of the power conversion system. Array of structure (ncomp).

member	type	description
name	string (7.9.8.1.4)	name of the component
temp_in	float (7.9.8.1.2)	temperature of the input [K];Scalar
temp_out	float (7.9.8.1.2)	temperature of the output [K];Scalar
press_in	float (7.9.8.1.2)	Pressure of the input[Pa];Scalar
press_out	float (7.9.8.1.2)	Pressure of the output [Pa];Scalar
power	float (7.9.8.1.2)	electric consumption by the component; (consumption power)[W];Scalar
flow	float (7.9.8.1.2)	Flow through the component [kg/s]; Scalar

Type of: circuits:component (4205)

7.9.8.1.365 power_exchange

member	type	description
dep_pow	vecflt_type (7.9.8.1.18)	Power deposited in each bb module (the reference outboard module if only value is given) [W]; Vector(nmodules)
dep_fw	float (7.9.8.1.2)	Power deposited in the first wall (heat flux + neutrons) [W]; Scalar
dep_sg	float (7.9.8.1.2)	Power deposited in the stiffening grid (neutrons) [W]; Scalar
dep_cp	float (7.9.8.1.2)	Power deposited in the cooling plates (neutrons) [W]; Scalar
dep_lp	float (7.9.8.1.2)	Power deposited in the Pb-15.7Li (neutrons) [W]; Scalar
dep_man	float (7.9.8.1.2)	Power deposited in the manifolds (neutrons) [W]; Scalar
dep_pl	float (7.9.8.1.2)	Power deposited in the protect layer (made of tungsten) (neutrons) [W]; Scalar
rec_fw	float (7.9.8.1.2)	Power recovered from He in first wall channels [W]; Scalar
rec_sg	float (7.9.8.1.2)	Power recovered from He in stiffening grid channels [W]; Scalar
rec_cp	float (7.9.8.1.2)	Power recovered from He in cooling plates channels [W]; Scalar
pow_dens_fw	float (7.9.8.1.2)	Peak energy depostion in first wall [W.m^-3]; Scalar
pow_dens_bz	float (7.9.8.1.2)	Peak energy depostion in breeding zone [W.m^-3]; Scalar
pow_dens_bz10	float (7.9.8.1.2)	Peak energy depostion in breeding zone (first ten centimers) [W.m^-3]; Scalar
pow_dens_bp	float (7.9.8.1.2)	Peak energy depostion in back plate [W.m^-3]; Scalar
pow_dens_man	float (7.9.8.1.2)	Peak energy depostion in manifold [W.m^-3]; Scalar
pow_dens_sh	float (7.9.8.1.2)	Peak energy depostion in shield [W.m^-3]; Scalar

Type of: mode_neutr:pow_exchange (4402)

7.9.8.1.366 powerflow

Power flow along the ray/beam.

member	type	description
phi_perp	vecflt_type (7.9.8.1.18)	Normalized power flow in the direction perpendicular to the magnetic field; Vector (npoints). Time-dependent
phi_par	vecflt_type (7.9.8.1.18)	Normalized power flow in the direction parallel to the magnetic field; Vector (npoints). Time-dependent
power_e	vecflt_type (7.9.8.1.18)	Power absorbed along the beam by electrons [W]; Vector (npoints). Time-dependent
power_i	matflt_type (7.9.8.1.15)	Power absorbed along the beam by an ion species [W]; Matrix (npoints, nion). Time-dependent

Type of: beamtracing:powerflow (4192)

7.9.8.1.367 profiles1d

Profiles derived from the fields solved in the transport equations, or from experiment.

member	type	description
pe	coreprofile (7.9.8.1.151)	Electron pressure [Pa]; Time-dependent;
dpedt	coreprofile (7.9.8.1.151)	Time derivative of the electron pressure [Pa/s]; Time-dependent;
pi	coreprofion (7.9.8.1.152)	Ion pressure [Pa]; Time-dependent;

member	type	description
pi_tot	coreprofile (7.9.8.1.151)	Total ion pressure (sum of the species) [Pa]; Time-dependent;
dpi_totdt	coreprofile (7.9.8.1.151)	Time derivative of the total ion pressure [Pa/s]; Time-dependent;
pr_th	coreprofile (7.9.8.1.151)	Thermal pressure (electrons+ions) [Pa]; Time-dependent;
pr_perp	coreprofile (7.9.8.1.151)	Total perpendicular pressure (electrons+ions, thermal+non-thermal) [Pa]; Time-dependent;
pr_parallel	coreprofile (7.9.8.1.151)	Total parallel pressure (electrons+ions, thermal+non-thermal) [Pa]; Time-dependent;
jtot	coreprofile (7.9.8.1.151)	total parallel current density = average(jtot.B) / B0, where B0 = coreprof/toroid_field/b0 [A/m^2]; Time-dependent;
jni	coreprofile (7.9.8.1.151)	non-inductive parallel current density = average(jni.B) / B0, where B0 = coreprof/toroid_field/b0 [A/m^2]; Time-dependent;
jphi	coreprofile (7.9.8.1.151)	total toroidal current density = average(jphi/R) / average(1/R) [A/m^2]; Time-dependent;
joh	coreprofile (7.9.8.1.151)	ohmic parallel current density = average(joh.B) / B0, where B0 = coreprof/toroid_field/b0 [A/m^2]; Time-dependent;
vloop	coreprofile (7.9.8.1.151)	Toroidal loop voltage [V]. Time-dependent.
sigmapar	coreprofile (7.9.8.1.151)	Parallel conductivity [ohm^-1.m^-1]. Time-dependent.
qoh	sourceel (7.9.8.1.435)	ohmic heating [W/m^3]; Time-dependent;
qei	coreprofile (7.9.8.1.151)	Collisional heat transfer from electrons to ions (equipartition term) [W/m^3]; Time-dependent;
eparallel	coreprofile (7.9.8.1.151)	Parallel electric field = average(E.B) / B0, where B0 = coreprof/toroid_field/b0 [V.m^-1]. Time-dependent.
e_b	coreprofile (7.9.8.1.151)	Average(E.B) [V.T.m^-1]. Time-dependent.
q	coreprofile (7.9.8.1.151)	Safety factor profile; Time-dependent;
shear	coreprofile (7.9.8.1.151)	Magnetic shear profile; Time-dependent;
ns	coreprofion (7.9.8.1.152)	Density of fast ions, for the various ion species [m^-3]; Time-dependent;
mtor	coreprofion (7.9.8.1.152)	Toroidal momentum of the various ion species [UNITS?]; Time-dependent;
wtor	coreprofion (7.9.8.1.152)	Angular toroidal rotation frequency of the various ion species [s^-1]; Time-dependent;
vpol	coreprofion (7.9.8.1.152)	Neoclassical poloidal rotation of each ion species [m/s]. Time-dependent.
zeff	coreprofile (7.9.8.1.151)	Effective charge profile; Time-dependent;
bpol	coreprofile (7.9.8.1.151)	Average poloidal magnetic field, defined as sqrt(ave(grad rho^2/R^2)).dpsi/drho [T]. Time-dependent.
dvprimedt	coreprofile (7.9.8.1.151)	Time derivative of the radial derivative of the volume enclosed in the flux surface, i.e. d/dt(dV/drho_tor) [m^2.s^-1]; Time-dependent.

Type of: coreprof:profiles1d (4137)

7.9.8.1.368 profiles_1d

output profiles as a function of the poloidal flux

member	type	description
psi	vecflt_type (7.9.8.1.18)	Poloidal flux [Wb], without 1/2pi and such that Bp=|grad psi| /R/2/pi. Time-dependent; Vector (npsi)
phi	vecflt_type (7.9.8.1.18)	toroidal flux [Wb]; Time-dependent; Vector (npsi)
pressure	vecflt_type (7.9.8.1.18)	pressure profile as a function of the poloidal flux [Pa]; Time-dependent; Vector (npsi)
F_dia	vecflt_type (7.9.8.1.18)	diamagnetic profile (R B_phi) [T m]; Time-dependent; Vector (npsi)
pprime	vecflt_type (7.9.8.1.18)	psi derivative of the pressure profile [Pa/Wb]; Time-dependent; Vector (npsi)
ffprime	vecflt_type (7.9.8.1.18)	psi derivative of F_dia multiplied with F_dia [T^2 m^2/Wb]; Time-dependent; Vector (npsi)
jphi	vecflt_type (7.9.8.1.18)	flux surface averaged toroidal current density = average(jphi/R) / average(1/R) [A/m^2]; Time-dependent; Vector (npsi)
jparallel	vecflt_type (7.9.8.1.18)	flux surface averaged parallel current density = average(j.B) / B0, where B0 = equilibrium/global_param/toroid_field/b0 ; [A/m^2]; Time-dependent; Vector (npsi)
q	vecflt_type (7.9.8.1.18)	Safety factor = dphi/dpsi [-]; Time-dependent; Vector (npsi)
shear	vecflt_type (7.9.8.1.18)	Magnetic shear, defined as rho_tor/q*dq/drho_tor [-]; Time-dependent; Vector (npsi)
r_inboard	vecflt_type (7.9.8.1.18)	radial coordinate (major radius) at the height and on the left of the magnetic axis [m]; Time-dependent; Vector (npsi)
r_outboard	vecflt_type (7.9.8.1.18)	radial coordinate (major radius) at the height and on the right of the magnetic axis [m]; Time-dependent; Vector (npsi)
rho_tor	vecflt_type (7.9.8.1.18)	Toroidal flux coordinate [m], to be used by the ETS and in many CPOs (coreprof, ...). Defined as sqrt(phi/pi/B0), where B0 = equilibrium/global_param/toroid_field/b0. Time-dependent; Vector (npsi)
dpsidrho_tor	vecflt_type (7.9.8.1.18)	dpsi/drho_tor [Wb/m]; Time-dependent; Vector (npsi)
rho_vol	vecflt_type (7.9.8.1.18)	Normalised radial coordinate related to the plasma volume. Defined as sqrt(volume / volume[LCFS]). Time-dependent; Vector (npsi)
beta_pol	vecflt_type (7.9.8.1.18)	poloidal beta (inside the magnetic surface); Time-dependent; Vector (npsi)
li	vecflt_type (7.9.8.1.18)	internal inductance (inside the magnetic surface); Time-dependent; Vector (npsi)
elongation	vecflt_type (7.9.8.1.18)	Elongation; Time-dependent; Vector (npsi)
tria_upper	vecflt_type (7.9.8.1.18)	Upper triangularity profile; Time-dependent; Vector (npsi)

member	type	description
tria_lower	vecflt_type (7.9.8.1.18)	Lower triangularity profile; Time-dependent; Vector (npsi)
volume	vecflt_type (7.9.8.1.18)	Volume enclosed in the flux surface [m^3]; Time-dependent; Vector (npsi)
vprime	vecflt_type (7.9.8.1.18)	Radial derivative of the volume enclosed in the flux surface with respect to psi, i.e. dV/dpsi [m^3/Wb]; Time-dependent; Vector (npsi)
dvdrho	vecflt_type (7.9.8.1.18)	Radial derivative of the volume enclosed in the flux surface with respect to rho_tor, i.e. dV/drho_tor [m^2]; Time-dependent; Vector (npsi)
area	vecflt_type (7.9.8.1.18)	Cross-sectional area of the flux surface [m^2]; Time-dependent; Vector (npsi)
aprime	vecflt_type (7.9.8.1.18)	Radial derivative of the cross-sectional area of the flux surface with respect to psi, i.e. darea/dpsi [m^2/Wb]; Time-dependent; Vector (npsi)
surface	vecflt_type (7.9.8.1.18)	Surface area of the flux surface [m^2]; Time-dependent; Vector (npsi)
ftrap	vecflt_type (7.9.8.1.18)	Trapped particle fraction; Time-dependent; Vector (npsi)
gm1	vecflt_type (7.9.8.1.18)	average(1/R^2); Time-dependent; Vector (npsi)
gm2	vecflt_type (7.9.8.1.18)	average(grad_rho^2/R^2); Time-dependent; Vector (npsi)
gm3	vecflt_type (7.9.8.1.18)	average(grad_rho^2); Time-dependent; Vector (npsi)
gm4	vecflt_type (7.9.8.1.18)	average(1/B^2) [T^-2]; Time-dependent; Vector (npsi)
gm5	vecflt_type (7.9.8.1.18)	average(B^2) [T^2]; Time-dependent; Vector (npsi)
gm6	vecflt_type (7.9.8.1.18)	average(grad_rho^2/B^2) [T^-2]; Time-dependent; Vector (npsi)
gm7	vecflt_type (7.9.8.1.18)	average(grad_rho); Time-dependent; Vector (npsi)
gm8	vecflt_type (7.9.8.1.18)	average(R); Time-dependent; Vector (npsi)
gm9	vecflt_type (7.9.8.1.18)	average(1/R); Time-dependent; Vector (npsi)
b_av	vecflt_type (7.9.8.1.18)	average(B); Time-dependent; Vector (npsi)
b_min	vecflt_type (7.9.8.1.18)	minimum(B) on the flux surface; Time-dependent; Vector (npsi)
b_max	vecflt_type (7.9.8.1.18)	maximum(B) on the flux surface; Time-dependent; Vector (npsi)
omega	vecflt_type (7.9.8.1.18)	Toroidal rotation angular frequency (assumed constant on the flux surface) [rad/s]; Time-dependent; Vector (npsi)
omegaprime	vecflt_type (7.9.8.1.18)	Psi derivative of the toroidal rotation angular frequency (assumed constant on the flux surface) [rad/(s.Wb)]; Time-dependent; Vector (npsi)
mach_a	vecflt_type (7.9.8.1.18)	Alfvenic Mach number; Time-dependent; Vector (npsi)
phi_flow	vecflt_type (7.9.8.1.18)	Poloidal flow function phi_flow = rho*v_pol/B_pol[kg/(V.s^2)] where rho is mass density; Time-dependent; Vector (npsi)
s_flow	vecflt_type (7.9.8.1.18)	Flux function in the closure equation p=S(psi).rho^(gamma); Entropy (gamma=5/3) or Temperature (gamma=1); Time-dependent; Vector (npsi)
h_flow	vecflt_type (7.9.8.1.18)	flow function h_flow = gamma/(gamma-1)*s_flow*rho^(gamma-1) + 0.5*(phi_flow*B/rho)^2 - 0.5*(R*omega)^2 [m^2/s^2]; Time-dependent; Vector (npsi)
rho_mass	vecflt_type (7.9.8.1.18)	Mass density [kg/m^3]; Time-dependent; Vector (npsi)

Type of: equilibrium:profiles_1d (4146)

7.9.8.1.369 psi

Poloidal magnetic flux [Wb]; Time-dependent;

member	type	description
value	vecflt_type (7.9.8.1.18)	Signal value [Wb]; Time-dependent; Vector (nrho)
ddrho	vecflt_type (7.9.8.1.18)	Radial derivative (dvalue/drho_tor) [Wb.m^-1]; Time-dependent; Vector (nrho)
d2drho2	vecflt_type (7.9.8.1.18)	Second order radial derivative (d2value/drho_tor2) [Wb.m^-2]; Time-dependent; Vector (nrho)
ddt_rhotorn	vecflt_type (7.9.8.1.18)	Time derivative of the poloidal flux at constant rho_tor_norm [V]. Time-dependent.
ddt_phi	vecflt_type (7.9.8.1.18)	Time derivative of the poloidal flux at constant toroidal flux [V]. Time-dependent.
source	string (7.9.8.1.4)	Source of the profile (any comment describing the origin of the profile : code, path to diagnostic signals, massaging, ...); String
flag	integer (7.9.8.1.3)	Flag describing how the profile has been processed : 0-not calculated; 1-interpretative; 2-calculated by the transport solver; 3-calculated by a separate code : in that case only, description of the code provided in codeparam at the same level; 4-used value from the previous time step; Time-dependent; Scalar
boundary	boundary (7.9.8.1.93)	Boundary condition for the transport equation. Time-dependent.
jni	jni (7.9.8.1.270)	Non-inductive parallel current density [A/m^2]; Time-dependent;
sigma_par	coreprofile (7.9.8.1.151)	Parallel conductivity [ohm^-1.m^-1]. Time-dependent
codeparam	codeparam (7.9.8.1.105)	Code parameters

Type of: coreprof:psi (4137)

7.9.8.1.370 putinfo

Structure which is type independent, describing the data item

member	type	description
putmethod	string (7.9.8.1.4)	Storage method for this data
putaccess	string (7.9.8.1.4)	Instructions to access the data using this method
putlocation	string (7.9.8.1.4)	Name of this data under this method
rights	string (7.9.8.1.4)	Access rights to this data

Type of: datainfo:putinfo (4265)

7.9.8.1.371 q

Safety factor

member	type	description
qvalue	vecflt_type (7.9.8.1.18)	Safety factor values; Time-dependent; Vector (nmeas)
position	rz1D (7.9.8.1.387)	Major radius of the given safety factor values [m]; Time-dependent; Vector (nmeas)
source	string (7.9.8.1.4)	Description or path to the source signal (diagnostic or genprof, from which to read all info on the signal), e.g. 'magdiag/bpol_probes/measure/value'. String
exact	integer (7.9.8.1.3)	1 means exact data, is not fitted; 0 means the equilibrium code does a least square fit; scalar integer
weight	vecflt_type (7.9.8.1.18)	weight given to the measurement (¿= 0); Time-dependent; Vector (nmeas)
sigma	vecflt_type (7.9.8.1.18)	standard deviation of the measurement; Time-dependent; Vector (nmeas)
calculated	vecflt_type (7.9.8.1.18)	Signal as recalculated by the equilibrium code; Time-dependent; Vector (nmeas)
chi2	vecflt_type (7.9.8.1.18)	chiˆ2 of (calculated-measured); Time-dependent; Vector (nmeas)

Type of: eqconstraint:q (4320)

7.9.8.1.372 reacprodType

Characterizes a reactant or product in an AMNS reaction.

member	type	description
label	string (7.9.8.1.4)	String identifier for reaction participant (e.g. "D", "e", "W", "CD4", "photon", "n").
constituents(:)	amns_constituentType (7.9.8.1.75)	Array specifying the constituents of this reactant/product; For an atom or ion the array will be of length 1, for a molecule there will be more than one element in the array; Vector (nconst)
role	identifier (7.9.8.1.263)	Identifier for the role of this paricipant in the reaction. For surface reactions distinguish between projectile and wall.
amn	float (7.9.8.1.2)	Mass of the participant (amu).
relative	integer (7.9.8.1.3)	This is a flag indicating that charges are absolute (if set to 0), relative (if 1) or irrelevant (-1); relative would be used to categorize the ionization reactions from i to i+1 for all charge states; in the case of bundles, the +1 relative indicates the next bundle.
za	float (7.9.8.1.2)	Charge of the participant. Not set if not important (e.g. for a nuclear reaction). For the case where we are describing a set of reactions for different charge states, then this is the relative charge.
multiplicity	float (7.9.8.1.2)	Multiplicity in the reaction
metastable	vecint_type (7.9.8.1.19)	An array identifying the metastable; if zero-length, then not a metastable; if of length 1, then the value indicates the electronic level for the metastable (mostly used for atoms/ions); if of length 2, then the 1st would indicate the electronic level and the second the vibrational level for the metastable (mostly used for molecules and molecular ions); if of length 3, then the 1st would indicate the electronic level, the second the vibrational level and the third the rotational level for the metastable (mostly used for molecules and molecular ions)
metastable_label	string (7.9.8.1.4)	Label identifying in text form the metastable

Type of: amns_processType:product (4179) I amns_processType:reactant (4179)

7.9.8.1.373 react

In the reactor region

member	type	description
he_fr	float (7.9.8.1.2)	Coolant mass flow rate in the whole reactor [Kg/s]; Scalar
lp_fr	float (7.9.8.1.2)	Pb-15.7Li mass flow rate in the whole reactor [Kg/s]; Scalar
he_dp	float (7.9.8.1.2)	Coolant pressure drops in the reactor (compressing pipelines) [Pa]; Scalar

member	type	description
lipb_dp	float (7.9.8.1.2)	Pb-15.7Li pressure drops in the reactor [Pa]; Scalar

Type of: hcll_bb:react (4363)

7.9.8.1.374 rectanglexyz

Rectangle defined by its four corners. These form an ordered sequence: point00, point01, point11, point10. Here the first point can be calculated from the other three as point00=point01+poin10-point11, thus the rectangle is defined by the triplet (point01, point11, point10). The normal vector of this rectangle is defined to be in the direction (point01-point11)x(point10-point11).

member	type	description
point01	xyz0D (7.9.8.1.537)	Point 01 on the rectangle
point11	xyz0D (7.9.8.1.537)	Point 11 on the rectangle
point10	xyz0D (7.9.8.1.537)	Point 10 on the rectangle

Type of: nbi_nbi_unit_wall_surface:rectangle (4416)

7.9.8.1.375 recycling_neutrals

Recycling coefficients

member	type	description
particles	vecflt_type (7.9.8.1.18)	Particle recycling coefficient corresponding to the conversion to the neutral type INEUT. Vector(nneut,). Time-dependent.
energy	vecflt_type (7.9.8.1.18)	Energy recycling coefficient corresponding to the conversion to the neutral type INEUT. Vector(nneut). Time-dependent.

Type of: coefficients_neutrals:recycling (4209)

7.9.8.1.376 reduced

Structure for a reduced data signal (0D data)

member	type	description
value	float (7.9.8.1.2)	Data value; Real
source	string (7.9.8.1.4)	Path to the source signal (diagnostic or genprof, from which to read all info on the signal); String
time	float (7.9.8.1.2)	Time (exact time slice used from the time array of the source signal); Real

7.9.8.1.377 refl_receive

Reflectometry signal; experimental or code output. Time-dependent. Vector(nreceivers); If output from ERC3D, contains short, high-resolution (ps) time series anchored to the time of the CPO or, for a combination of runs, longer, coarse time signals. For experimental signals, time series may span much longer durations. For slowly varying signals, may contain only one point and have a seperate CPO instance with different time field for every point. For code output, the signals are usually normalised to unity power.

member	type	description
name	string (7.9.8.1.4)	Signal name
raw_signal	t_series_real (7.9.8.1.447)	Raw antenna signal, possibly code dependent, may not always be available; usually without mixing of local oscillator; Time series; Vector (ntime_raw); Time-dependent
io_signal	t_series_real (7.9.8.1.447)	Local oscillator signal, for mixing with raw signal; Time series; Vector (ntime_raw); Time-dependent
iq_receiver	t_series_cplx (7.9.8.1.446)	I and Q signals from the receiver; already processed by code (or hardware); Time series; Vector (ntime_receiver); Time-dependent
antenna_ind	integer (7.9.8.1.3)	Index of the receiving antenna in the antennas vector, starting at 0

Type of: reflectomet:refl_receive (4166)

7.9.8.1.378 reflectometry_antennas

Vector of reflectometry antenna descriptions. These include radiation fields as well as material antenna structures (feeds, horns, later mirrors); Vector(nantennas); refl_received entries refer to their antenna by index in this array.

member	type	description
name	string (7.9.8.1.4)	Antenna name
type	identifier (7.9.8.1.263)	Antenna type: 1: sending, 2: receiving, 3: both
origin	origin (7.9.8.1.337)	NO DOCS
radfield	reflectometry_radfield (7.9.8.1.379)	Complex valued radiation field for injection into grid; Can be a Gaussian, or a waveguide mode, or an arbitrary E field. The latter method can be used with measured radiation patterns of actual antennas. Needs to be matched with any material structures in the geometry section of this CPO. Frequency dependence: in the launchsignal part, the lauch frequency can be varied arbitrarily, which changes the radiation field (or Gaussian waist sizes) when radiated from a fixed size antenna; therefor, all entries here can be specified frequency-dependent; Time-dependent
geometry	float (7.9.8.1.2)	To be defined: annotation and type
launchsignal	launchsignal (7.9.8.1.279)	NO DOCS

Type of: reflectomet:antennas (4166)

7.9.8.1.379 reflectometry_radfield

Complex valued radiation field for injection into grid; Can be a Gaussian, or a waveguide mode, or an arbitrary E field. The latter method can be used with measured radiation patterns of actual antennas. Needs to be matched with any material structures in the geometry section of this CPO. Frequency dependence: in the launchsignal part, the lauch frequency can be varied arbitrarily, which changes the radiation field (or Gaussian waist sizes) when radiated from a fixed size antenna; therefor, all entries here can be specified frequency-dependent

member	type	description
type	identifier (7.9.8.1.263)	Identify type of source: 0: Gaussian, 1: waveguide mode, 2: arbitrary E field; corresponding substructure must be filled to provide the information.
position	vecflt_type (7.9.8.1.18)	Center position in local x-y-z coordinate system [m]; Vector(3)
gaussian(:)	reflectometry_radfield_gaussian (7.9.8.1.380)	Parameters if radiation field is a pure Gaussian; major axes of the Gaussian are aligned with the x and y axis of the local coordinate system given in origin; linear polarisation only. Time-dependent
efield(:)	reflectometry_radifield_efield (7.9.8.1.381)	complex electric field at the aperture, given as a 2d grid in the local x and y directions (corresponding to dim1 and dim2); Time-dependent

Type of: reflectometry_antennas:radfield (4481)

7.9.8.1.380 reflectometry_radfield_gaussian

Parameters if radiation field is a pure Gaussian; major axes of the Gaussian are aligned with the x and y axis of the local coordinate system given in origin; linear polarisation only; Time-dependent

member	type	description
aperture	simp_apert (7.9.8.1.428)	Physical limits of the Gaussian wave field; any rotation here is at odds with the Gaussian geometry
waistsize	vecflt_type (7.9.8.1.18)	Beam waist size [m]; Vector(2)
waistzpos	vecflt_type (7.9.8.1.18)	Beam waist position along local z axis [m]; Vector(2)
tiltangle	vecflt_type (7.9.8.1.18)	tilt angle relative to local z axis [rad]; Vector(2)
polar_angle	vecflt_type (7.9.8.1.18)	Polarisation angle around local z [rad]; 0 means along the local x axis, i.e. vertical if all angles in the origin field are 0; Scalar
frequency	float (7.9.8.1.2)	Frequency for this occurrence of the gaussian/efield/wgmode CPO [Hz]; Scalar; can be zero of no frequency dependence is desired and only one CPO is given; Time-dependent

Type of: reflectometry_radfield:gaussian (4482)

7.9.8.1.381 reflectometry_radifield_efield

complex electric field at the aperture, given as a 2d grid in the local x and y directions (corresponding to dim1 and dim2); Time-dependent

member	type	description
grid2d	reggrid (7.9.8.1.382)	Coordinate values for the grid for the electric field arrays. Vector(ndim1) and Vector(ndim2); Time-dependent
e1	matcplx_type (7.9.8.1.14)	Electric field component along local x direction [V/m]. Matrix(ndim1,ndim2); Time-dependent
e2	matcplx_type (7.9.8.1.14)	Electric field component along local y direction [V/m]. Matrix(ndim1,ndim2); Time-dependent
frequency	float (7.9.8.1.2)	Frequency for this occurrence of the gaussian/efield/wgmode CPO [Hz]; Scalar; can be zero of no frequency dependence is desired and only one CPO is given; Time-dependent

Type of: reflectometry_radfield:efield (4482)

7.9.8.1.382 reggrid

Generic structure for a regular grid

member	type	description
dim1	vecflt_type (7.9.8.1.18)	First dimension values; Vector (ndim1)
dim2	vecflt_type (7.9.8.1.18)	Second dimension values; Vector (ndim2)

Type of: coord_sys:grid (4232) I reflectometry_radifield_efield:grid2d (4484)

7.9.8.1.383 rfameasure

Measured values

member	type	description
ti	exp1D (7.9.8.1.225)	Ion temperature [eV]. Vector (nchannels)

Type of: rfadiag:measure (4167)

7.9.8.1.384 rfasetup

diagnostic setup information

member	type	description
position	rzphi1Dexp (7.9.8.1.394)	Position of the measurement. Time-dependent. Vector (nchannels)

Type of: rfadiag:setup (4167)

7.9.8.1.385 rfbeam

Beam characteristics

member	type	description
spot	spot (7.9.8.1.442)	Spot characteristics
phaseellipse	phaseellipse (7.9.8.1.357)	Phase ellipse characteristics

Type of: antenna_ec:beam (4180) I antenna_lh:beam (4182)

7.9.8.1.386 rz0D

Structure for one (R,Z) position (0D)

member	type	description
r	float (7.9.8.1.2)	Major radius [m]
z	float (7.9.8.1.2)	Altitude [m]

Type of: circularcoil:centre (4206) I current:rz_reference (4261) I dist_geometry_0d:mag_axis (4278) I distsource_global_param: (4298) I eqgeometry:active_limit (4321) I eqgeometry:geom_axis (4321) I eqgeometry:left_low_st (4321) I eqgeometry:left_up_st (4321) I eqgeometry:right_low_st (4321) I eqgeometry:right_up_st (4321) I globalparam:geom_axis (4360) I mag_axis:position (4389) I waves_global_param:mag_axis (4629)

7.9.8.1.387 rz1D

Structure for list of R,Z positions (1D)

member	type	description
r	vecflt_type (7.9.8.1.18)	Major radius [m]
z	vecflt_type (7.9.8.1.18)	Altitude [m]

Type of: flush:position (4334) I isoflux:position (4372) I limiter_unit:position (4383) I mhd_ideal_wall2d:position (4394) I mhd_res_wall2d:position (4397) I omnigen_surf:rz (4434) I planecoil:coordinates (4461) I q:position (4474) I setup_bprobe:position (4525) I solcurdiag_sol_current_setup:position (4533) I straps:coord_strap (4547) I wall_blocks_unit:position (4616) I wall_vessel_annular:inside (4623) I wall_vessel_annular:outside (4623) I xpts:position (4639)

7.9.8.1.388 rz1D_npoints

Structure for list of R,Z positions (1D), with mention of the number of points relevant for a given time slice

member	type	description
r	vecflt_type (7.9.8.1.18)	Major radius [m]. Vector(max_npoints). Time-dependent
z	vecflt_type (7.9.8.1.18)	Altitude [m]. Vector(max_npoints). Time-dependent
npoints	integer (7.9.8.1.3)	Number of meaningful points in the above vectors at a given time slice. Time-dependent

7.9.8.1.389 rz1Dexp

Structure for list of R,Z positions (1D), with R and Z time-depent and experimental.

member	type	description
r	vecflt_type (7.9.8.1.18)	Major radius [m]. Vector(npoints). Time-dependent
z	vecflt_type (7.9.8.1.18)	Altitude [m]. Vector(npoints). Time-dependent

Type of: eqgeometry:boundary (4321) I eqgeometry:xpts (4321)

7.9.8.1.390 rz2D

Structure for list of R,Z positions (2D)

member	type	description
r	matflt_type (7.9.8.1.15)	Major radius [m]
z	matflt_type (7.9.8.1.15)	Altitude [m]

Type of: coord_sys:position (4232) I geom_iron:rzcoordinate (4358) I pfpageometry:rzcoordinate (4456)

7.9.8.1.391 rz3D

Structure for list of R,Z positions (3D)

member	type	description
r	array3dflt_type (7.9.8.1.7)	Major radius [m]
z	array3dflt_type (7.9.8.1.7)	Altitude [m]

Type of: pfgeometry:rzcoordinate (4455)

7.9.8.1.392 rzphi0D

Structure for a single R,Z,phi position (0D)

member	type	description
r	float (7.9.8.1.2)	Major radius [m]
z	float (7.9.8.1.2)	Altitude [m]
phi	float (7.9.8.1.2)	Toroidal angle [rad]

Type of: antenna_ec:position (4180) I antenna_lh:position (4182) I beamletgroup:position (4190) I fusiondiag_voxels:centre (4356) I fusiondiag_voxels:direction (4356) I msediag_setup:pivot_point (4412) I msediag_setup:second_point (4412) I origin:refpos (4440) I pellet_geometry:pivot_point (4447) I pellet_geometry:second_point (4447)

7.9.8.1.393 rzphi1D

Structure for list of R,Z,phi positions (1D)

member	type	description
r	vecflt_type (7.9.8.1.18)	Major radius [m]
z	vecflt_type (7.9.8.1.18)	Altitude [m]
phi	vecflt_type (7.9.8.1.18)	Toroidal angle [rad]

Type of: beamlets:position (4191) I edges:edge_rzphi (4315) I fusiondiag_colliunit_circ:centre (4345) I halpha_setup:pivot_poir (4361) I halpha_setup:second_point (4361) I launchs:position (4153) I lithsetup:position (4387) I msediag_emiss_chord:setup (4407) I pellet_pathprofiles:position (4449) I setup_line:pivot_point (4527) I setup_line:second_point (4527) I setup_line:third_point (4527) I tssetup:position (4599)

7.9.8.1.394 rzphi1Dexp

Structure for list of R,Z,phi positions (1D) with experimental structure (value, abserror, relerror)

member	type	description
r	exp1D (7.9.8.1.225)	Major radius [m]
z	exp1D (7.9.8.1.225)	Altitude [m]
phi	exp1D (7.9.8.1.225)	Toroidal angle [rad]

Type of: cxsetup:position (4263) I ecemeasure:position (4305) I lang_derived:position (4374) I lang_measure:position (4375) I rfasetup:position (4487)

7.9.8.1.395 rzphi1Dexperimental

Structure for list of R,Z,phi positions (1D) with additional appinfo tags to have some nodes both in MD and DM

member	type	description
r	vecflt_type (7.9.8.1.18)	Major radius [m]
z	vecflt_type (7.9.8.1.18)	Altitude [m]
phi	vecflt_type (7.9.8.1.18)	Toroidal angle [rad]

Type of: setup_line_exp:pivot_point (4528) I setup_line_exp:second_point (4528) I setup_line_exp:third_point (4528)

7.9.8.1.396 rzphi2D

Structure for list of R,Z,phi positions (2D)

member	type	description
r	matflt_type (7.9.8.1.15)	Major radius [m]
z	matflt_type (7.9.8.1.15)	Altitude [m]
phi	matflt_type (7.9.8.1.15)	Toroidal angle [rad]

Type of: fusiondiag_colliunit_poly:nodes (4346) I setup_floops:position (4526)

7.9.8.1.397 rzphi3D

Structure for list of R,Z,phi positions (3D)

member	type	description
r	array3dflt_type (7.9.8.1.7)	Major radius [m]

member	type	description
z	array3dflt_type (7.9.8.1.7)	Altitude [m]
phi	array3dflt_type (7.9.8.1.7)	Toroidal angle [rad]

Type of: turbcoordsys:position (4601)

7.9.8.1.398 rzphidrdzdphi1D

Structure for list of R,Z,phi positions and width dR dZ dphi (1D)

member	type	description
r	vecflt_type (7.9.8.1.18)	Position : major radius [m]
z	vecflt_type (7.9.8.1.18)	Position : altitude [m]
phi	vecflt_type (7.9.8.1.18)	Position : toroidal angle [rad]
dr	vecflt_type (7.9.8.1.18)	Width : major radius [m]
dz	vecflt_type (7.9.8.1.18)	Width : altitude [m]
dphi	vecflt_type (7.9.8.1.18)	Width : toroidal angle [rad]

Type of: msediag_setup_polarimetry:rzgamma (4413)

7.9.8.1.399 sawteeth_diags

Inversion and mixing radii

member	type	description
shear1	float (7.9.8.1.2)	Magnetic shear at q = 1 [-]. Time-dependent. Real scalar.
rhotorn_q1	float (7.9.8.1.2)	Rho_tor_norm at q=1 radius [-]. Time-dependent. Real scalar.
rhotorn_inv	float (7.9.8.1.2)	Rho_tor_norm at inversion radius [-]. Time-dependent. Real scalar.
rhotorn_mix	float (7.9.8.1.2)	Rho_tor_norm at mixing radius [-]. Time-dependent. Real scalar.
pr_crash_trig	integer (7.9.8.1.3)	Previous crash trigger. Flag indicating whether a crash condition has been satisfied : 0 = no crash. N(¿0) = crash triggered due to condition ii=N. Integer. Time-dependent.
pr_crash_time	float (7.9.8.1.2)	Previous crash time [s]. Time-dependent. Real scalar.
pr_st_period	float (7.9.8.1.2)	Previous sawtooth period [s]. Time-dependent. Real scalar.

Type of: sawteeth:diags (4168)

7.9.8.1.400 sawteeth_profiles1d

Core profiles after sawtooth crash

member	type	description
psi	vecflt_type (7.9.8.1.18)	Poloidal magnetic flux [Wb]. Time-dependent. Vector (nrho).
psistar	vecflt_type (7.9.8.1.18)	Psi* = psi - phi [Wb]. Time-dependent. Vector (nrho).
q	vecflt_type (7.9.8.1.18)	Safety factor = dphi/dpsi [-]. Time-dependent. Vector (nrho).

Type of: sawteeth:profiles1d (4168)

7.9.8.1.401 scenario_centre

central values of the profiles (at magnetic axis)

member	type	description
te0	scenario_ref (7.9.8.1.418)	central electron temperature [eV]. Time-dependent.
ti0	scenario_ref (7.9.8.1.418)	central ion temperature [eV]. Time-dependent.
ne0	scenario_ref (7.9.8.1.418)	central electron density [m^-3]. Time-dependent.
ni0	scenario_ref (7.9.8.1.418)	central ion density [m^-3]. Time-dependent.
shift0	scenario_ref (7.9.8.1.418)	central value of Shafranov shift [m]. Time-dependent.
psi0	scenario_ref (7.9.8.1.418)	pedestal poloidal flux [Wb]. Time-dependent.
phi0	scenario_ref (7.9.8.1.418)	central toroidal flux [Wb]. Time-dependent.
q0	scenario_ref (7.9.8.1.418)	central safety factor value []. Time-dependent.

member	type	description
Rmag	scenario_ref (7.9.8.1.418)	radius of magnetic axis [R]. Time-dependent.
Zmag	scenario_ref (7.9.8.1.418)	Z coordinate of magnetic axis [R]. Time-dependent.
vtor_0	scenario_ref (7.9.8.1.418)	central rotation velocity of selected impurity [m/s]. Time-dependent.

Type of: scenario:centre (4169)

7.9.8.1.402 scenario_composition

Plasma composition (description of ion species).

member	type	description
amn	vecflt_type (7.9.8.1.18)	Atomic mass number (lumped ions are allowed); Vector (nion)
zn	vecflt_type (7.9.8.1.18)	Nuclear charge (lumped ions are allowed); Vector (nion)
zion	vecflt_type (7.9.8.1.18)	Ion charge (of the dominant ionisation state; lumped ions are allowed); Vector (nion)
imp_flag	vecint_type (7.9.8.1.19)	Multiple charge state calculation flag : 0-Only one charge state is considered; 1-Multiple charge state are considered and are described in impurity CPO; Vector (nion)
rot_imp_flag	vecint_type (7.9.8.1.19)	set to 1 for the impurity corresponding at the given toroidal rotation, otherwise = 0
pellet_amn	vecflt_type (7.9.8.1.18)	Atomic mass number (for pellet injector); Vector (nion)
pellet_zn	vecflt_type (7.9.8.1.18)	Nuclear charge (pellet injector); Vector (nion)
nbi_amn	vecflt_type (7.9.8.1.18)	Atomic mass number (for neutral beam injection); Vector (nion)
nbi_zn	vecflt_type (7.9.8.1.18)	Nuclear charge (for neutral beam injection); Vector (nion)

Type of: scenario:composition (4169)

7.9.8.1.403 scenario_configuration

Strings describing the tokamak configuration

member	type	description
config	scenario_int (7.9.8.1.410)	plasma configuration (limiter/divertor ...) []. Time-dependent. Possible values : 0 = undetermined; 1 = poloidal limiter (ring); 2 = poloidal limiter (LFS); 3 = poloidal limiter (HFS); 4 = toroidal limiter (ring); 5 = toroidal limiter (segment); 6 = poloidal divertor; 7 = toroidal divertor (single null, ion drift in direction of divertor); 8 = toroidal divertor (single null, ion drift in oposite direction of divertor); 9 = toroidal divertor (double null).
lmode_sc	string (7.9.8.1.4)	name of the L-mode scaling law. String.
hmode_sc	string (7.9.8.1.4)	name of the H-mode scaling law. String.
core_sc	string (7.9.8.1.4)	name of the core plasma energy scaling law. String.
pedestal_sc	string (7.9.8.1.4)	name of the pedestal energy scaling law. String.
helium_sc	string (7.9.8.1.4)	name of the helium confinement time scaling law. String.
impurity_sc	string (7.9.8.1.4)	name of the impurities confinement time scaling law
l2h_sc	string (7.9.8.1.4)	name of the L-mode to H-mode power threshold scaling law. String.
tor_rot_sc	string (7.9.8.1.4)	name of the toroidal spontaneous rotation scaling law. String.
wall_mat	string (7.9.8.1.4)	chemical compostion of the wall. String.
evap_mat	string (7.9.8.1.4)	chemical compostion evaporated wall conditioning material. String.
lim_mat	string (7.9.8.1.4)	chemical compostion of the limiter. String.
div_mat	string (7.9.8.1.4)	chemical compostion of the divertor
coordinate	string (7.9.8.1.4)	name/definition of the internal coordinate of the simulator that are given by the data named rho
ecrh_freq	scenario_ref (7.9.8.1.418)	ECRH frequency [Hz]. Time-dependent.
ecrh_loc	scenario_ref (7.9.8.1.418)	position of maximum ECRH deposition on scale of rho [rho]. Time-dependent.
ecrh_mode	scenario_int (7.9.8.1.410)	polarisation of ecrh wave (0 = O mode, 1 = X mode) []. Time-dependent.
ecrh_tor_ang	scenario_ref (7.9.8.1.418)	toroidal angle of ECRH at resonance [rad] Time-dependent.
ecrh_pol_ang	scenario_ref (7.9.8.1.418)	poloidal angle of ECRH resonance positon (0= LFS, pi/2 = top, -pi/2 = down, pi = HFS) [rad]. Time-dependent.
ecrh_harm	scenario_int (7.9.8.1.410)	harmonic number of the apsorbed ecrh wave []. Time-dependent.
enbi	scenario_ref (7.9.8.1.418)	energy of the neutral beam [eV]. Time-dependent.
r_nbi	scenario_ref (7.9.8.1.418)	Major radius of tengance of NBI [m]. Time-dependent.
grad_b_drift	scenario_int (7.9.8.1.410)	direction of ion grad-B drift (1= to lower divertor, -1 = from lower divertor) []. Time-dependent.
icrh_freq	scenario_ref (7.9.8.1.418)	ICRH frequency [Hz]. Time-dependent.
icrh_scheme	string (7.9.8.1.4)	icrh scheme either : H_min_1; He3_min; T_harm_2; FW; FW_CD; FW_CCD
icrh_phase	scenario_ref (7.9.8.1.418)	ICRH antenna phasing [rad]. Time-dependent.
LH_freq	scenario_ref (7.9.8.1.418)	LHCD frequency [Hz]. Time-dependent.

member	type	description
LH_npar	scenario_ref (7.9.8.1.418)	LHCD parallel indice []. Time-dependent.
pellet_ang	scenario_ref (7.9.8.1.418)	pellet injection positon (0= LFS, pi/2 = top, -pi/2 = down, pi = HFS) [rad]. Time-dependent.
pellet_v	scenario_ref (7.9.8.1.418)	pellet injection velocity [m/s]. Time-dependent.
pellet_nba	scenario_ref (7.9.8.1.418)	initial number of atoms in pellet []. Time-dependent.

Type of: scenario:configs (4169)

7.9.8.1.404 scenario_confinement

characteristic confinement times

member	type	description
tau_e	scenario_ref (7.9.8.1.418)	thermal energy confinement time [s]. Time-dependent.
tau_l_sc	scenario_ref (7.9.8.1.418)	confinement time given by the selected L-mode scaling law [s]. Time-dependent.
tau_h_sc	scenario_ref (7.9.8.1.418)	confinement time given by the selected H-mode scaling law [s]. Time-dependent.
tau_he	scenario_ref (7.9.8.1.418)	Helium ashes confinement time [s]. Time-dependent.
tau_e_ee	scenario_ref (7.9.8.1.418)	electron energy confinement time [s]. Time-dependent.
tau_e_ii	scenario_ref (7.9.8.1.418)	ion energy confinement time [s]. Time-dependent.
tau_e_ei	scenario_ref (7.9.8.1.418)	energy equipartition characteristic time [s]. Time-dependent.
tau_cur_diff	scenario_ref (7.9.8.1.418)	characteristic time for current diffusion [s]. Time-dependent.
tau_i_rol	scenario_ref (7.9.8.1.418)	characteristic time for current decrease in tokamak equivalent R/L circuit [s]. Time-dependent.

Type of: scenario:confinement (4169)

7.9.8.1.405 scenario_currents

data related to current sources and current diffusion

member	type	description
RR	scenario_ref (7.9.8.1.418)	plasma resistivity [ohm]. Time-dependent.
i_align	scenario_ref (7.9.8.1.418)	current drive alignment quality parameter (1 = good , 0 = bad). Time-dependent.
i_boot	scenario_ref (7.9.8.1.418)	bootstrap current [A]. Time-dependent.
i_cd_tot	scenario_ref (7.9.8.1.418)	total current drive [A]. Time-dependent.
i_eccd	scenario_ref (7.9.8.1.418)	Electron Cyclotron current drive [A]. Time-dependent.
i_fast_ion	scenario_ref (7.9.8.1.418)	fast ions bootstrap like current drive (i.e. fast alpha) [A]. Time-dependent.
i_fwcd	scenario_ref (7.9.8.1.418)	Fast Wave current drive [A]. Time-dependent.
i_lhcd	scenario_ref (7.9.8.1.418)	Lower Hybrid current drive [A]. Time-dependent.
i_nbicd	scenario_ref (7.9.8.1.418)	Neutral Beam Injection current drive [A]. Time-dependent.
i_ni_tot	scenario_ref (7.9.8.1.418)	total non inductive current [A]. Time-dependent.
i_ohm	scenario_ref (7.9.8.1.418)	ohmic current [A]. Time-dependent.
i_par	scenario_ref (7.9.8.1.418)	total plasma current (projected on B : <J.B¿/B0) [A]. Time-dependent.
i_runaway	scenario_ref (7.9.8.1.418)	runaway current [A]. Time-dependent.
v_loop	scenario_ref (7.9.8.1.418)	loop voltage @ LCMS / LFS , equatorial point [V]. Time-dependent.
v_meas	scenario_ref (7.9.8.1.418)	loop voltage measured on a coil [V]. Time-dependent.

Type of: scenario:currents (4169)

7.9.8.1.406 scenario_edge

edge value (@ LCMS)

member	type	description
te_edge	scenario_ref (7.9.8.1.418)	edge electron temperature [eV]. Time-dependent.
ti_edge	scenario_ref (7.9.8.1.418)	edge ion temperature [eV]. Time-dependent.
ne_edge	scenario_ref (7.9.8.1.418)	edge electron density [m^-3]. Time-dependent.
ni_edge	scenario_ref (7.9.8.1.418)	edge ion density [m^-3]. Time-dependent.
psi_edge	scenario_ref (7.9.8.1.418)	edge poloidal flux [Wb]. Time-dependent.
phi_edge	scenario_ref (7.9.8.1.418)	edge toroidal flux [Wb]. Time-dependent.
rho_edge	scenario_ref (7.9.8.1.418)	edge value of internal simulator coordinate [m]. Time-dependent.
drho_edge_dt	scenario_ref (7.9.8.1.418)	time derivative of edge value of internal simulator coordinate [m/s]. Time-dependent.

member	type	description
q_edge	scenario_ref (7.9.8.1.418)	edge or effective safety factor value []. Time-dependent.
neutral_flux	scenario_ref (7.9.8.1.418)	number of cold neutral (in equivalent electron for Z ¿1) that input in plasma at the edge every second coming from recycling and gaz puff [s^-1]. Time-dependent.
phi_plasma	scenario_ref (7.9.8.1.418)	contribution of the plasma to the toroidal flux (used for toroidal coils heat load computation) [Wb]. Time-dependent.
vtor_edge	scenario_ref (7.9.8.1.418)	rotation velocity of selected impurity on the separatrix [m/s]. Time-dependent.

Type of: scenario:edge (4169)

7.9.8.1.407 scenario_energy

plasma energy content

member	type	description
w_tot	scenario_ref (7.9.8.1.418)	total plasma energy [J]. Time-dependent.
w_b_pol	scenario_ref (7.9.8.1.418)	poloidal field energy of the plasma [J]. Time-dependent.
w_dia	scenario_ref (7.9.8.1.418)	3/2 perpendicular plasma energy [J]. Time-dependent.
dwdia_dt	scenario_ref (7.9.8.1.418)	time derivative of Wdia [W]. Time-dependent.
w_b_tor_pla	scenario_ref (7.9.8.1.418)	toroidal magnetic plasma energy [J]. Time-dependent.
w_th	scenario_ref (7.9.8.1.418)	thermal plasma energy [J]. Time-dependent.
dwtot_dt	scenario_ref (7.9.8.1.418)	time derivative of total plasma energy [W]. Time-dependent.
dwbpol_dt	scenario_ref (7.9.8.1.418)	time derivative of plasma poloidal field energy [W]. Time-dependent.
dwbtorpla_dt	scenario_ref (7.9.8.1.418)	time derivative of toroidal magnetic plasma energy [W]. Time-dependent.
dwth_dt	scenario_ref (7.9.8.1.418)	time derivative of thermal plasma energy [W]. Time-dependent.
esup_icrhtot	scenario_ref (7.9.8.1.418)	total suprathermal energy of fast ions accelerated by ICRH [J]. Time-dependent.
esup_icrhper	scenario_ref (7.9.8.1.418)	perpendicular part of suprathermal energy of fast ions accelerated by ICRH [J]. Time-dependent.
esup_nbitot	scenario_ref (7.9.8.1.418)	total suprathermal energy of fast ions from NBI ionisation [J]. Time-dependent.
esup_nbiperp	scenario_ref (7.9.8.1.418)	perpendicular part of suprathermal energy of fast ions from NBI ionisation [J]. Time-dependent.
esup_lhcd	scenario_ref (7.9.8.1.418)	total suprathermal energy of fast electron from LHCD [J]. Time-dependent.
esup_alpha	scenario_ref (7.9.8.1.418)	total suprathermal energy of fast alpha particules [J]. Time-dependent.

Type of: scenario:energy (4169)

7.9.8.1.408 scenario_global

global scalar value

member	type	description
ip	scenario_ref (7.9.8.1.418)	Plasma current [A]. Time-dependent.
dip_dt	scenario_ref (7.9.8.1.418)	time derivative of plasma current [A/s]. Time-dependent.
beta_pol	scenario_ref (7.9.8.1.418)	poloidal beta []. Time-dependent.
beta_tor	scenario_ref (7.9.8.1.418)	toroidal beta []. Time-dependent.
beta_normal	scenario_ref (7.9.8.1.418)	normalised beta []. Time-dependent.
li	scenario_ref (7.9.8.1.418)	internal inductance (definition 3). Time-dependent.
volume	scenario_ref (7.9.8.1.418)	total plasma volume [m^3]. Time-dependent.
area_pol	scenario_ref (7.9.8.1.418)	area poloidal cross section [m^2]. Time-dependent.
area_ext	scenario_ref (7.9.8.1.418)	external plasma surface [m^2]. Time-dependent.
len_sepa	scenario_ref (7.9.8.1.418)	length of the separatrix [m]. Time-dependent.
beta_pol_th	scenario_ref (7.9.8.1.418)	poloidal beta, thermal contribution []. Time-dependent.
beta_tor_th	scenario_ref (7.9.8.1.418)	toroidal beta, thermal contribution []. Time-dependent.
beta_n_th	scenario_ref (7.9.8.1.418)	normalised beta, thermal contribution []. Time-dependent.
disruption	scenario_ref (7.9.8.1.418)	flag for disruption (set to 1 for disruption, oterwise equal 0) []. Time-dependent.
mode_h	scenario_ref (7.9.8.1.418)	confinement mode verus time: 0 = L-mode et 1 = H-mode []. Time-dependent.
s_alpha	scenario_ref (7.9.8.1.418)	total number of alpha fusion particules from D-T ractions per second [s^-1]. Time-dependent.

Type of: scenario:global_param (4169)

7.9.8.1.409 scenario_heat_power

Power delivred to plasma (thermal an non thermal)

member	type	description
plh	scenario_ref (7.9.8.1.418)	Lower hybrid power [W]. Time-dependent.
pohmic	scenario_ref (7.9.8.1.418)	ohmic power (thermal species contribution only) [W]. Time-dependent.
picrh	scenario_ref (7.9.8.1.418)	Ion cyclotron resonnance heating power [W]. Time-dependent.
pecrh	scenario_ref (7.9.8.1.418)	electron cyclotron resonnance heating power [W]. Time-dependent.
pnbi	scenario_ref (7.9.8.1.418)	neutral beam injection power [W]. Time-dependent.
pnbi_co_cur	scenario_ref (7.9.8.1.418)	neutral beam injection power injeted in co-current direction [W]. Time-dependent.
pnbi_counter	scenario_ref (7.9.8.1.418)	neutral beam injection power injeted in counter-current direction [W]. Time-dependent.
plh_th	scenario_ref (7.9.8.1.418)	lower hybrid power deposited on thermal electrons [W]. Time-dependent.
picrh_th	scenario_ref (7.9.8.1.418)	ion cyclotron resonnance heating power deposited on thermal species [W]. Time-dependent.
pecrh_th	scenario_ref (7.9.8.1.418)	electron cyclotron resonnance heating power deposited on thermal electrons [W]. Time-dependent.
pnbi_th	scenario_ref (7.9.8.1.418)	neutral beam injection power deposited on thermal species [W]. Time-dependent.
ploss_icrh	scenario_ref (7.9.8.1.418)	Ion cyclotron resonnance heating power losses [W]. Time-dependent.
ploss_nbi	scenario_ref (7.9.8.1.418)	neutral beam injection power losses (including shine-through) [W]. Time-dependent.
pbrem	scenario_ref (7.9.8.1.418)	Bremsstrahlung radition losses [W]. Time-dependent.
pcyclo	scenario_ref (7.9.8.1.418)	cyclotron radiation losses [W]. Time-dependent.
prad	scenario_ref (7.9.8.1.418)	impurity radition losses in core plamsa , without Bremsstrahlung [W]. Time-dependent.
pdd_fus	scenario_ref (7.9.8.1.418)	fusion power due to DD reactions [W]. Time-dependent.
pei	scenario_ref (7.9.8.1.418)	power exchange between eletron and ion (equipartition) [W]. Time-dependent.
pel_tot	scenario_ref (7.9.8.1.418)	total thermal electron power deposition without equipartition [W]. Time-dependent.
pel_fus	scenario_ref (7.9.8.1.418)	fusion electron power deposition [W]. Time-dependent.
pel_icrh	scenario_ref (7.9.8.1.418)	ICRH electron power deposition [W]. Time-dependent.
pel_nbi	scenario_ref (7.9.8.1.418)	NBI electron power deposition [W]. Time-dependent.
pfus_dt	scenario_ref (7.9.8.1.418)	total D-T fusion power of alpha [W]. Time-dependent.
ploss_fus	scenario_ref (7.9.8.1.418)	D-T fusion power of alpha losses [W]. Time-dependent.
pfus_nbi	scenario_ref (7.9.8.1.418)	NBI induce D-T fusion power of alpha [W]. Time-dependent.
pfus_th	scenario_ref (7.9.8.1.418)	alpha (from DT fusion reaction) power deposited on thermal species [W]. Time-dependent.
padd_tot	scenario_ref (7.9.8.1.418)	total additional power input including ohmic power [W]. Time-dependent.
pion_tot	scenario_ref (7.9.8.1.418)	total thermal ion power deposition without equipartition [W]. Time-dependent.
pion_fus	scenario_ref (7.9.8.1.418)	fusion ion power deposition [W]. Time-dependent.
pion_icrh	scenario_ref (7.9.8.1.418)	ICRH ion power deposition [W]. Time-dependent.
pion_nbi	scenario_ref (7.9.8.1.418)	NBI ion power deposition [W]. Time-dependent.
pioniz	scenario_ref (7.9.8.1.418)	power losses due to cold neutral ionization [W]. Time-dependent.
ploss	scenario_ref (7.9.8.1.418)	plasma losses power, as define in ITER basis [W]. Time-dependent.
p_wth	scenario_ref (7.9.8.1.418)	thermal power input, define as tau_E * P_th = Wth [W]. Time-dependent.
p_w	scenario_ref (7.9.8.1.418)	effective power define as tau_E * P_w = W_tot [W]. Time-dependent.
p_l2h_thr	scenario_ref (7.9.8.1.418)	additionnal power crossing the LCMS; must be compare to L-¿H threshold power (Ryter PPCF 2002) [W]. Time-dependent.
p_l2h_sc	scenario_ref (7.9.8.1.418)	threshold power given by the choosen scaling law for transition from L-mode to H-mode [W]. Time-dependent.
p_nbi_icrh	scenario_ref (7.9.8.1.418)	beam power increase due to ICRH effects [W]. Time-dependent.

Type of: scenario:heat_power (4169)

7.9.8.1.410 scenario_int

Structure for scenario integer flag; Time-dependent

member	type	description
value	integer (7.9.8.1.3)	Signal value; Time-dependent; Scalar Integer.
source	string (7.9.8.1.4)	Source of the signal (any comment describing the origin of the signal : code, path to diagnostic signals, massaging, ...); String

Type of: scenario_configuration:config (4506) I scenario_configuration:ecrh_harm (4506) I scenario_configuration:ecrh_mode (4506) I scenario_configuration:grad_b_drift (4506) I scenario_itb:itb_type (4514)

7.9.8.1.411 scenario_itb

Values characteristics of the Internal Transport Barrier

member	type	description
q_min	scenario_ref (7.9.8.1.418)	minimal value of safety factor []. Time-dependent.
te_itb	scenario_ref (7.9.8.1.418)	electron temperature @ q = q_min [eV]. Time-dependent.
ti_itb	scenario_ref (7.9.8.1.418)	ion temperature @ q = q_min [eV]. Time-dependent.
ne_itb	scenario_ref (7.9.8.1.418)	electron density @ q = q_min [m^-3]. Time-dependent.
ni_itb	scenario_ref (7.9.8.1.418)	ion density @ q = q_min [m^-3]. Time-dependent.
psi_itb	scenario_ref (7.9.8.1.418)	poloidal flux @ q = q_min [Wb]. Time-dependent.
phi_itb	scenario_ref (7.9.8.1.418)	toroidal flux @ q = q_min [Wb]. Time-dependent.
rho_itb	scenario_ref (7.9.8.1.418)	value of internal simulator coordinate @ q = q_min [m]. Time-dependent.
h_itb	scenario_ref (7.9.8.1.418)	energy enhancement ITB factor [m]. Time-dependent.
width_itb	scenario_ref (7.9.8.1.418)	width of the high pressure gradient region (on scale of rho_itb) [m]. Time-dependent.
vtor_itb	scenario_ref (7.9.8.1.418)	rotation velocity of selected impurity @ rho_itb [m/s]. Time-dependent.
itb_type	scenario_int (7.9.8.1.410)	itb type []. Time-dependent. Any combinaison of :0 = none; 1 = on T_i; 2 = on T_e; 4 = on n_e; 8 = reverse shear triggered; 16 = toroidal rotation triggered; 32 = alpha stabilisation triggered; 64 = T_i /T_e triggered; 128 = radiation triggered; 256 = rationnal q triggered

Type of: scenario:itb (4169)

7.9.8.1.412 scenario_lim_div_wall

values on the plate of divertor or on the limitor or on the wall (@ LCMS)

member	type	description
te_lim_div	scenario_ref (7.9.8.1.418)	limiter/divertor electron temperature [eV]. Time-dependent.
ti_lim_div	scenario_ref (7.9.8.1.418)	limiter/divertor ion temperature [eV]. Time-dependent.
ne_lim_div	scenario_ref (7.9.8.1.418)	limiter/divertor electron density [m^-3]. Time-dependent.
ni_lim_div	scenario_ref (7.9.8.1.418)	limiter/divertor ion density [m^-3]. Time-dependent.
q_peak_div	scenario_ref (7.9.8.1.418)	Peak power flux on limiter or divertor plate [W.m^-2]. Time-dependent.
q_peak_wall	scenario_ref (7.9.8.1.418)	Peak power flux on the wall [W.m^-2]. Time-dependent.
surf_temp	scenario_ref (7.9.8.1.418)	limiter surface or divertor plate temperature [K]. Time-dependent.
p_lim_div	scenario_ref (7.9.8.1.418)	Total power on limiter or divertor plate [W]. Time-dependent.
p_rad_div	scenario_ref (7.9.8.1.418)	radiative power in the divertor zone [W]. Time-dependent.
p_neut_div	scenario_ref (7.9.8.1.418)	Neutral pressure in the divertor zone [Pa]; Time-dependent.
p_wall	scenario_ref (7.9.8.1.418)	Total power on the wall [W]. Time-dependent.
wall_temp	scenario_ref (7.9.8.1.418)	wall temperature [K]. Time-dependent.
wall_state	scenario_ref (7.9.8.1.418)	saturation state of the wall (0 = completly pumping wall, 1 = competely saturate wall) []. Time-dependent.
detach_state	scenario_ref (7.9.8.1.418)	plasma detachement state (0= attach plasma, 1 = completely detach plasma) []. Time-dependent.
pump_flux	scenario_ref (7.9.8.1.418)	flux pump out for each ion species [s^-1]. Time-dependent.
p_rad_fw	scenario_ref (7.9.8.1.418)	Radiated power on the first wall [W]; Time-dependent
p_cond_fw	scenario_ref (7.9.8.1.418)	Conducted/convected power on the first wall [W]; Time-dependent
div_wetted	scenario_ref (7.9.8.1.418)	Divertor wetted area [m^2]; Time-dependent
gas_puff	scenario_ref (7.9.8.1.418)	Gas puff (D/T) in the divertor (PFR) [Pa.m^3.s^-1]; Time-dependent
ar_concentr	scenario_ref (7.9.8.1.418)	Argon concentration in the divertor; Time-dependent
part_exhaust	scenario_ref (7.9.8.1.418)	Assuming a pumping speed [Pa.m^3.s^-1]; Time-dependent
f_inner	scenario_ref (7.9.8.1.418)	Fraction of power to the inner divertor; Time-dependent
f_outer	scenario_ref (7.9.8.1.418)	Fraction of power to the outer divertor; Time-dependent
f_pfr	scenario_ref (7.9.8.1.418)	Fraction of power flowing into the private flux region; Time-dependent
f_rad_fw	scenario_ref (7.9.8.1.418)	Fraction of the divertor radiated power deposited in the main chamber; Time-dependent
q_div	vecflt_type (7.9.8.1.18)	Heat flux on divertor plate [W/m^2]; Vector(theta). Time-dependent
p_cond_div	scenario_ref (7.9.8.1.418)	Conducted/convected power on divertor plate [W]; Time-dependent
pol_ext	float (7.9.8.1.2)	Poloidal extension of the divertor or outer major radius of the divertor region (and inner major radius) [rad]; Scalar
flux_exp	float (7.9.8.1.2)	Flux expansion at the divertor plate ((B_theta/B)midplane)/((B_theta/B)target); Scalar
tilt_angle	float (7.9.8.1.2)	Tilt angle between the field lines and the divertor plate in a poloidal plane [rad]; Scalar
n_div	float (7.9.8.1.2)	Number of divertor, assuming symmetric configuration; Scalar
div_dz	float (7.9.8.1.2)	Divertor extension in z direction from the x-point [m]; Scalar
div_dro	float (7.9.8.1.2)	Divertor extension in r outward direction from the x-point [m]; Scalar
div_dri	float (7.9.8.1.2)	Divertor extension in r intward direction from the x-point [m]; Scalar

member	type	description
p_nh_div	scenario_ref (7.9.8.1.418)	Total nuclear heating in divertor [W]. Time-dependent.

Type of: scenario:lim_div_wall (4169)

7.9.8.1.413 scenario_line_ave

line averaged value

member	type	description
ne_line	scenario_ref (7.9.8.1.418)	line averaged electron density [m^-3]. Time-dependent.
zeff_line	scenario_ref (7.9.8.1.418)	line averaged effective charge. Time-dependent.
ne_zeff_line	scenario_ref (7.9.8.1.418)	line averaged electron density * Zeff . Time-dependent.
dne_line_dt	scenario_ref (7.9.8.1.418)	time derivative of line averaged electron density [m^-3/s]. Time-dependent.

Type of: scenario:line_ave (4169)

7.9.8.1.414 scenario_neutron

neutron flux for DD and DT reactions

member	type	description
ndd_tot	scenario_ref (7.9.8.1.418)	total neutron flux coming from DD reactions [Hz]. Time-dependent.
ndd_th	scenario_ref (7.9.8.1.418)	neutron flux coming from thermal DD reactions [Hz]. Time-dependent.
ndd_nbi_th	scenario_ref (7.9.8.1.418)	neutron flux coming from beam/plasma DD reactions [Hz]. Time-dependent.
ndd_nbi_nbi	scenario_ref (7.9.8.1.418)	neutron flux coming from beam/beam DD reactions [Hz]. Time-dependent.
ndt_tot	scenario_ref (7.9.8.1.418)	total neutron flux coming from DT reactions [Hz]. Time-dependent.
ndt_th	scenario_ref (7.9.8.1.418)	neutron flux coming from thermal DT reactions [Hz]. Time-dependent.

Type of: scenario:neutron (4169)

7.9.8.1.415 scenario_ninety_five

values at 95% of poloidal flux

member	type	description
q_95	scenario_ref (7.9.8.1.418)	safety factor value @ 95 % of poloidal flux span []. Time-dependent.
elong_95	scenario_ref (7.9.8.1.418)	plasma elongation @ 95 % of poloidal flux span []. Time-dependent.
tria_95	scenario_ref (7.9.8.1.418)	averaged plasma triangularity @ 95 % of poloidal flux span []. Time-dependent.
tria_up_95	scenario_ref (7.9.8.1.418)	upper plasma triangularity @ 95 % of poloidal flux span []. Time-dependent.
tria_lo_95	scenario_ref (7.9.8.1.418)	lower plasma triangularity @ 95 % of poloidal flux span []. Time-dependent.
te_95	scenario_ref (7.9.8.1.418)	electron temperature @ 95 % of poloidal flux [eV]. Time-dependent.
ti_95	scenario_ref (7.9.8.1.418)	ion temperature @ 95 % of poloidal flux [eV]. Time-dependent.
ne_95	scenario_ref (7.9.8.1.418)	electron density @ 95 % of poloidal flux [m^-3]. Time-dependent.
ni_95	scenario_ref (7.9.8.1.418)	ion density @ 95 % of poloidal flux [m^-3]. Time-dependent.
phi_95	scenario_ref (7.9.8.1.418)	toroidal flux @ 95 % of poloidal flux [Wb]. Time-dependent.
rho_95	scenario_ref (7.9.8.1.418)	value of internal simulator coordinate @ 95 % of poloidal flux [m]. Time-dependent.
vtor_95	scenario_ref (7.9.8.1.418)	rotation velocity of selected impurity @ 95 % of poloidal flux [m/s]. Time-dependent.

Type of: scenario:ninety_five (4169)

7.9.8.1.416 scenario_pedestal

Values at the top of the H-mode pedestal

member	type	description
te_ped	scenario_ref (7.9.8.1.418)	pedestal electron temperature [eV]. Time-dependent.
ti_ped	scenario_ref (7.9.8.1.418)	pedestal ion temperature [eV]. Time-dependent.
ne_ped	scenario_ref (7.9.8.1.418)	pedestal electron density [m^-3]. Time-dependent.
ni_ped	scenario_ref (7.9.8.1.418)	pedestal ion density [m^-3]. Time-dependent.
psi_ped	scenario_ref (7.9.8.1.418)	pedestal poloidal flux [Wb]. Time-dependent.

member	type	description
phi_ped	scenario_ref (7.9.8.1.418)	pedestal toroidal flux [Wb]. Time-dependent.
rho_ped	scenario_ref (7.9.8.1.418)	top pedestal value of internal simulator coordinate [m]. Time-dependent.
q_ped	scenario_ref (7.9.8.1.418)	top pedestal safety factor value []. Time-dependent.
pressure_ped	scenario_ref (7.9.8.1.418)	top pedestal thermal pressure (n_e * T_e + n_i * T_i) [Pa]. Time-dependent.
vtor_ped	scenario_ref (7.9.8.1.418)	top pedestal value of rotation velocity of selected impurity [m/s]. Time-dependent.

Type of: scenario:pedestal (4169)

7.9.8.1.417 scenario_reactor

reactor data (such as electricity cost ...)

member	type	description
pnetwork	float (7.9.8.1.2)	reactor electric power provide to the network [W].

Type of: scenario:reactor (4169)

7.9.8.1.418 scenario_ref

Structure for scenario reference; Time-dependent

member	type	description
value	float (7.9.8.1.2)	Signal value; Time-dependent; Scalar
source	string (7.9.8.1.4)	Source of the signal (any comment describing the origin of the signal : code, path to diagnostic signals, massaging, ...); String

Type of: scenario_centre:Rmag (4504) I scenario_centre:Zmag (4504) I scenario_centre:ne0 (4504) I scenario_centre:ni0 (4504) I scenario_centre:phi0 (4504) I scenario_centre:psi0 (4504) I scenario_centre:q0 (4504) I scenario_centre:shift0 (4504) I scenario_centre:te0 (4504) I scenario_centre:ti0 (4504) I scenario_centre:vtor_0 (4504) I scenario_configuration:LH_freq (4506) I scenario_configuration:LH_npar (4506) I scenario_configuration:ecrh_freq (4506) I scenario_configuration:ecrh_loc (4506) I scenario_configuration:ecrh_pol_ang (4506) I scenario_configuration:ecrh_tor_ang (4506) I scenario_configuration:enb (4506) I scenario_configuration:icrh_freq (4506) I scenario_configuration:icrh_phase (4506) I scenario_configuration:pellet_ang (4506) I scenario_configuration:pellet_nba (4506) I scenario_configuration:pellet_v (4506) I scenario_configuration:r_nbi (4506) I scenario_confinement:tau_cur_diff (4507) I scenario_confinement:tau_e (4507) I scenario_confinement:tau_e_ee (4507) I scenario_confinement:tau_e_ei (4507) I scenario_confinement:tau_e_ii (4507) I scenario_confinement:tau_h_sc (4507) I scenario_confinement:tau_he (4507) I scenario_confinement:tau_i_rol (4507) I scenario_confinement:tau_l_sc (4507) I scenario_currents:RR (4508) I scenario_currents:i_align (4508) I scenario_currents:i_boot (4508) I scenario_currents:i_cd_tot (4508) I scenario_currents:i_eccd (4508) I scenario_currents:i_fast_ion (4508) I scenario_currents:i_fwcd (4508) I scenario_currents:i_lhcd (4508) I scenario_currents:i_nbicd (4508) I scenario_currents:i_ni_tot (4508) I scenario_currents:i_ohm (4508) I scenario_currents:i_par (4508) I scenario_currents:i_runaway (4508) I scenario_currents:v_loop (4508) I scenario_currents:v_meas (4508) I scenario_edge:drho_edge_dt (4509) I scenario_edge:ne_edge (4509) I scenario_edge:neutral_flux (4509) I scenario_edge:ni_edge (4509) I scenario_edge:phi_edge (4509) I scenario_edge:phi_plasma (4509) I scenario_edge:psi_edge (4509) I scenario_edge:q_edge (4509) I scenario_edge:rho_edge (4509) I scenario_edge:te_edge (4509) I scenario_edge:ti_edge (4509) I scenario_edge:vtor_edge (4509) I scenario_energy:dwbpol_dt (4510) I scenario_energy:dwbtorpla_dt (4510) I scenario_energy:dwdia_dt (4510) I scenario_energy:dwth_dt (4510) I scenario_energy:dwtot_dt (4510) I scenario_energy:esup_alpha (4510) I scenario_energy:esup_icrhper (4510) I scenario_energy:esup_icrhtot (4510) I scenario_energy:esup_lhcd (4510) I scenario_energy:esup_nbiperp (4510) I scenario_energy:esup_nbitot (4510) I scenario_energy:w_b_pol (4510) I scenario_energy:w_b_tor_pla (4510) I scenario_energy:w_dia (4510) I scenario_energy:w_th (4510) I scenario_energy:w_tot (4510) I scenario_global:area_ext (4511) I scenario_global:area_pol (4511) I scenario_global:beta_n_th (4511) I scenario_global:beta_normal (4511) I scenario_global:beta_pol (4511) I scenario_global:beta_pol_th (4511) I scenario_global:beta_tor (4511) I scenario_global:beta_tor_th (4511) I scenario_global:dip_dt (4511) I scenario_global:disruption (4511) I scenario_global:ip (4511) I scenario_global:len_sepa (4511) I scenario_global:li (4511) I scenario_global:mode_h (4511) I scenario_global:s_alpha (4511) I scenario_global:volume (4511) I scenario_heat_power:p_l2h_sc (4512) I scenario_heat_power:p_l2h_thr (4512) I scenario_heat_power:p_nbi_icrh (4512) I scenario_heat_power:p_w (4512) I scenario_heat_power:p_wth (4512) I scenario_heat_power:padd_tot (4512) I scenario_heat_power:pbrem (4512) I scenario_heat_power:pcyclo (4512) I scenario_heat_power:pdd_fus (4512) I scenario_heat_power:pecrh (4512) I scenario_heat_power:pecrh_th (4512) I scenario_heat_power:pei (4512) I scenario_heat_power:pel_fus (4512) I scenario_heat_power:pel_icrh (4512) I scenario_heat_power:pel_nbi (4512) I scenario_heat_power:pel_tot (4512) I scenario_heat_power:pfus_dt (4512) I scenario_heat_power:pfus_nbi (4512) I scenario_heat_power:pfus_th (4512) I scenario_heat_power:picrh

nbar	scenario_ref (7.9.8.1.418)	line averaged electron density [m^-3]. Time-dependent.
xecrh	scenario_ref (7.9.8.1.418)	position of maximum (normalized rho coordinate) of electron cyclotron resonnance heating power []. Time-dependent.
pol_flux	scenario_ref (7.9.8.1.418)	separatrix poloidal flux [Wb]. Time-dependent.
enhancement	scenario_ref (7.9.8.1.418)	energy enhancement factor []. Time-dependent.
isotopic	scenario_ref (7.9.8.1.418)	ratio between tritium and deuterium density (for burning plasma) []. Time-dependent.
nbi_td_ratio	scenario_ref (7.9.8.1.418)	ratio between tritium and deuterium power in neutral beam injection []. Time-dependent.
gas_puff	scenario_ref (7.9.8.1.418)	gas puff flux reference, in equivalent [electrons.s^-1]. Time-dependent.

Type of: scenario:references (4169)

7.9.8.1.420 scenario_sol

SOL characteristic (@ LCMS)

member	type	description
l_te_sol	scenario_ref (7.9.8.1.418)	electron temperature radial decay length [m]. Time-dependent.
l_ti_sol	scenario_ref (7.9.8.1.418)	ion temperature radial decay length [m]. Time-dependent.
l_ne_sol	scenario_ref (7.9.8.1.418)	electron density radial decay length [m]. Time-dependent.
l_ni_sol	scenario_ref (7.9.8.1.418)	ion density radial decay length [m]. Time-dependent.
l_qe_sol	scenario_ref (7.9.8.1.418)	electron heat flux radial decay length [m]. Time-dependent.
l_qi_sol	scenario_ref (7.9.8.1.418)	ion heat flux radial decay length [m]. Time-dependent.
p_rad_sol	scenario_ref (7.9.8.1.418)	radiative power of the SOL [W]. Time-dependent.
p_neut	float (7.9.8.1.2)	Neutral pressure of the SOL [Pa]; Scalar
gas_puff	scenario_ref (7.9.8.1.418)	gas puff flux for each ion species [s^-1]. Time-dependent.
delta_r_in	float (7.9.8.1.2)	Inner gap between the plasma and the first wall [m]; Scalar
delta_r_out	float (7.9.8.1.2)	Outer gap between the plasma and the first wall [m]; Scalar
r_in	float (7.9.8.1.2)	Inner radius of the first wall [m]; Scalar
r_out	float (7.9.8.1.2)	Outer radius of the first wall [m]; Scalar
sol_width	float (7.9.8.1.2)	Width of the SOL (the heat flux is assumed to fall off exponentially in the SOL according to the width parameter) [m]; Scalar

Type of: scenario:sol (4169)

7.9.8.1.421 scenario_vol_ave

volume averaged values

member	type	description
te_ave	scenario_ref (7.9.8.1.418)	volume averaged electron temperature [eV]. Time-dependent.
ti_ave	scenario_ref (7.9.8.1.418)	volume averaged ion temperature [eV]. Time-dependent.
ne_ave	scenario_ref (7.9.8.1.418)	volume averaged electron density [m^-3]. Time-dependent.
dne_ave_dt	scenario_ref (7.9.8.1.418)	time derivative of volume averaged electron density [m^-3/s]. Time-dependent.
ni_ave	scenario_ref (7.9.8.1.418)	volume averaged ion density (<sum(n_k)¿, k in species) [m^-3]. Time-dependent.
zeff_ave	scenario_ref (7.9.8.1.418)	volume averaged effective charge. Time-dependent.
ti_o_te_ave	scenario_ref (7.9.8.1.418)	volume averaged ion temperature over electron temperature (<Ti/Te¿) []. Time-dependent.
meff_ave	scenario_ref (7.9.8.1.418)	volume averaged effectice mass (<sum(n_k * m_k) ¿ / < sum(n_k)¿) []. Time-dependent.
pellet_flux	scenario_ref (7.9.8.1.418)	number of electrons fuelling the plasma every second coming from pellet injection [s^-1]. Time-dependent.
nions_ave	vecflt_type (7.9.8.1.18)	volume averaged ions densities (vector, one element per ion species) [m^-3]. Time-dependent.
omega_ave	scenario_ref (7.9.8.1.418)	bulk volume average toroidal rotation velocity (whole plasma) [rad/s]. Time-dependent.

Type of: scenario:vol_ave (4169)

7.9.8.1.422 setup_bprobe

diagnostic setup information

member	type	description
name	vecstring_type (7.9.8.1.20)	Name of the probe. Array of strings (nprobes).
id	vecstring_type (7.9.8.1.20)	ID of the probe. Array of strings (nprobes).
position	rz1D (7.9.8.1.387)	RZ of coil centre [m]; Vector (nprobes)
polangle	vecflt_type (7.9.8.1.18)	Poloidal angle of coil orientation (w.r.t. horizontal ?? to be checked) [rad]; Vector (nprobes)
torangle	vecflt_type (7.9.8.1.18)	Toroidal angle of coil orientation (0 if fully in the poloidal plane) [rad] ; Vector (nprobes)
area	vecflt_type (7.9.8.1.18)	Area of coil [m^2]; Vector (nprobes)
length	vecflt_type (7.9.8.1.18)	Length of coil [m]; Vector (nprobes)
turns	vecint_type (7.9.8.1.19)	Turns in the coil; Vector (nprobes)

Type of: bpol_probes:setup_bprobe (4201)

7.9.8.1.423 setup_floops

diagnostic setup information

member	type	description
name	vecstring_type (7.9.8.1.20)	Name of loop. Array of strings (nloops).
id	vecstring_type (7.9.8.1.20)	ID of loop. Array of strings (nloops).
position	rzphi2D (7.9.8.1.396)	List of (R,Z,phi) points defining the position of the loop (see data structure documentation FLUXLOOPposition.pdf); Matrices (nloops, max_npoints)
npoints	vecint_type (7.9.8.1.19)	Number of points describing each loop in the "position" matrices. Vector (nloops)

Type of: flux_loops:setup_floops (4335)

7.9.8.1.424 setup_line

Geometric description of the lines of sight for line integral diagnostic

member	type	description
pivot_point	rzphi1D (7.9.8.1.393)	Pivot point of each line of sight; Vector (nchords)
horchordang1	vecflt_type (7.9.8.1.18)	Angle [rad] of horizontal projection of l.o.s. with poloidal cross section (0 for HFS to LFS chord - see Convention_angles_interfdiag.pdf) [rad]. Vector (nchords)
verchordang1	vecflt_type (7.9.8.1.18)	Angle of chord with vertical axis (0 for bottom-top chord, Pi for top-bottom chord - see Convention_angles_interfdiag.pdf) [rad]; Vector (nchords)
width	vecflt_type (7.9.8.1.18)	Width of the laser beam (1/e) [m]; Vector (nchords)
second_point	rzphi1D (7.9.8.1.393)	Second point defining the line of sight together with the pivot_point. In case the probing wave is reflected, this should be the position of the mirror. This data is redundant with horchordang1 and verchordang1. Vector (nchords).
horchordang2	vecflt_type (7.9.8.1.18)	For reflected l.o.s. only (undefined otherwise) : Angle [rad] of horizontal projection of reflected l.o.s. with poloidal cross section (0 for HFS to LFS chord - see Convention_angles_interfdiag.pdf) [rad]. Vector (nchords)
verchordang2	vecflt_type (7.9.8.1.18)	For reflected l.o.s. only (undefined otherwise) : Angle of reflected chord with vertical axis (0 for bottom-top chord, Pi for top-bottom chord - see Convention_angles_interfdiag.pdf) [rad]; Vector (nchords)
third_point	rzphi1D (7.9.8.1.393)	Third point defining the reflected line of sight together with the second_point (undefined if the probing wave is not reflected). This data is redundant with horchordang2 and verchordang2. Vector (nchords).
nchordpoints	integer (7.9.8.1.3)	Number of points along the viewing chords (used for synthetic diagnostic signal reconstruction)

Type of: bolometer_setup:los (4195) I fusiondiag_colli_circ:setup_line (4342) I fusiondiag_colli_poly:setup_line (4343) I lineintegraldiag:setup_line (4385)

7.9.8.1.425 setup_line_exp

Geometric description of the lines of sight for line integral diagnostic with additional appinfo tags to have some nodes both in MD and DM

member	type	description
pivot_point	rzphi1Dexperimental (7.9.8.1.395)	Pivot point of each line of sight; Vector (nchords)
horchordang1	vecflt_type (7.9.8.1.18)	Angle [rad] of horizontal projection of l.o.s. with poloidal cross section (0 for HFS to LFS chord - see Convention_angles_interfdiag.pdf) [rad]. Vector (nchords)
verchordang1	vecflt_type (7.9.8.1.18)	Angle of chord with vertical axis (0 for bottom-top chord, Pi for top-bottom chord - see Convention_angles_interfdiag.pdf) [rad]; Vector (nchords)
width	vecflt_type (7.9.8.1.18)	Width of the laser beam (1/e) [m]; Vector (nchords)
second_point	rzphi1Dexperimental (7.9.8.1.395)	Second point defining the line of sight together with the pivot_point. In case the probing wave is reflected, this should be the position of the mirror. This data is redundant with horchordang1 and verchordang1. Vector (nchords).
horchordang2	vecflt_type (7.9.8.1.18)	For reflected l.o.s. only (undefined otherwise) : Angle [rad] of horizontal projection of reflected l.o.s. with poloidal cross section (0 for HFS to LFS chord - see Convention_angles_interfdiag.pdf) [rad]. Vector (nchords)
verchordang2	vecflt_type (7.9.8.1.18)	For reflected l.o.s. only (undefined otherwise) : Angle of reflected chord with vertical axis (0 for bottom-top chord, Pi for top-bottom chord - see Convention_angles_interfdiag.pdf) [rad]; Vector (nchords)
third_point	rzphi1Dexperimental (7.9.8.1.395)	Third point defining the reflected line of sight together with the second_point (undefined if the probing wave is not reflected). This data is redundant with horchordang2 and verchordang2. Vector (nchords).
nchordpoints	integer (7.9.8.1.3)	Number of points along the viewing chords (used for synthetic diagnostic signal reconstruction)

Type of: bremsstrahl_setup:los (4203) I ecesetup:los (4306)

7.9.8.1.426 shield

Shield

member	type	description
inboard	shield_specs (7.9.8.1.427)	Inboard
outboard	shield_specs (7.9.8.1.427)	Outboard

Type of: bb_shield:shield (4129)

7.9.8.1.427 shield_specs

Inboard

member	type	description
nmat	integer (7.9.8.1.3)	Number of materials; Scalar
composition	vecflt_type (7.9.8.1.18)	Inboard or outboard shield radial build the percentage of each material respectively (Meaning of the material index 1: Eurofer, 2: Pb-15.7Li, 3: He, 4: Water, 5: Tungsten Carbide, 6: Boron, 7: Tungsten, 8: Stainless Steel 316) in %vol; Vector(nmat).
r1	float (7.9.8.1.2)	Inner radius (nearest to the plasma), in the global tokamak coordinate system of the inboard or outboard shield located at the equatorial plane [m]; Scalar
r2	float (7.9.8.1.2)	Outer radius (farest to the plasma), in the global tokamak coordinate system of the inboard or outboard shield located at the equatorial plane [m]; Scalar
mass	float (7.9.8.1.2)	Mass of inboard or outboard shield [Kg]; Scalar

Type of: shield:inboard (4529) I shield:outboard (4529)

7.9.8.1.428 simp_apert

Simple aperture specification: rectangular or elliptical

member	type	description
type	identifier (7.9.8.1.263)	Shape identifier; 0: rectangular, 1: elliptical
sizes	vecflt_type (7.9.8.1.18)	Rectangular size a, b or diameters for elliptical shapes [m]; Time-dependent; Vector (2)
angle	float (7.9.8.1.2)	Rotation of aperture around its center [rad]

Type of: reflectometry_radfield_gaussian:aperture (4483)

7.9.8.1.429 solcurdiag_sol_current

Vector of toroidal rings of divertor tiles. Structure array(nrings). Time-dependent

member	type	description
setup	solcurdiag_sol_current_setup (7.9.8.1.430)	diagnostic setup information
measure	exp0D (7.9.8.1.224)	Measured value for the current through the toroidal ring of tiles [A]; Time-dependent; Scalar

Type of: solcurdiag:sol_current (4170)

7.9.8.1.430 solcurdiag_sol_current_setup

diagnostic setup information

member	type	description
name	string (7.9.8.1.4)	Name of the toroidally distributed tile set. String.
id	integer (7.9.8.1.3)	ID of the tile set as a scalar, to be used in connectivity. Integer.
position	rz1D (7.9.8.1.387)	RZ points defining the shape of the toroidal tile set [m]; Vector (npoints)
tiles_turn	integer (7.9.8.1.3)	Number of tiles used to get the full toroidal coverage; Scalar

Type of: solcurdiag_sol_current:setup (4532)

7.9.8.1.431 source_imp

Subtree containing source terms for the impurity species

member	type	description
exp	matflt_type (7.9.8.1.15)	Explicit source term [same unit as root quantity]. Time-dependent. Array2d (nrho,nzimp)
imp	matflt_type (7.9.8.1.15)	Implicit source term [s^-1.m^-3]. Time-dependent. Array2d (nrho,nzimp)

Type of: coresource_values:qz (4256) I coresource_values:sz (4256)

7.9.8.1.432 source_ion

Subtree containing source terms for the various ion species

member	type	description
exp	matflt_type (7.9.8.1.15)	Explicit source term [same unit as root quantity]. Time-dependent. Matrix (nrho,nion)
imp	matflt_type (7.9.8.1.15)	Implicit source term [s^-1.m^-3]. Time-dependent. Matrix (nrho,nion)

Type of: coresource_values:qi (4256) I coresource_values:si (4256) I coresource_values:ui (4256)

7.9.8.1.433 source_rate

Source density of particles in phase space (real space, velocity space, spin state).

member	type	description
grid	complexgrid (7.9.8.1.110)	Grid for storing the source-rate. Time-dependent; Complexgrid
value	complexgrid_scalar (7.9.8.1.115)	The source-rate of particles in phase space; given on grid [(m/s)^-3 m^-3 s^-1]. Time-dependent; Complexgrid_scalar
discrete	vecint_type (7.9.8.1.19)	List of indexes for the dimensions (coordinates) of grid for which the source is discretely distributed. For example consider a source of 3.5 MeV alpha particles provided on a grid with two coordinates; rho_tor and energy. To specify that the source is given at energies exactly equal to 3.5 MeV, let discret have length 1 and set discrete=(1)=2 since energy is dimension number 2. The source is then proportional to delta(1 - energy / 3.5MeV), where delta is the Direct delta distribution. Discrete dimensions can only be used when the grid is rectangular. Time-dependent; Vector(n_discrete_dimensions)
parameters	parameters (7.9.8.1.339)	Parameters used to defined the grid coordiantes. Time-dependent

Type of: distsource_source:source_rate (4302)

7.9.8.1.434 source_vec

Subtree containing vector source term (radial dimension only)

member	type	description
exp	vecflt_type (7.9.8.1.18)	Explicit source term [same unit as root quantity]. Time-dependent. Vector (nrho)
imp	vecflt_type (7.9.8.1.18)	Implicit source term [s^-1.m^-3]. Time-dependent. Vector (nrho)

Type of: coresource_values:qe (4256) I coresource_values:se (4256) I coresource_values:ujxb (4256)

7.9.8.1.435 sourceel

Structure for the total source term for the transport equation (electrons). Time-dependent;

member	type	description
value	vecflt_type (7.9.8.1.18)	Value of the source term; Time-dependent; Vector (nrho)
integral	vecflt_type (7.9.8.1.18)	Integral from 0 to rho of the source term. Time-dependent; Vector (nrho)
source	string (7.9.8.1.4)	Source of the profile (any comment describing the origin of the profile : code, path to diagnostic signals, massaging, ...); String

Type of: corefield:source_term (4238) I profiles1d:qoh (4470)

7.9.8.1.436 sourceimp

Structure for the total source term for the transport equation (impurities). Time-dependent;

member	type	description
value	matflt_type (7.9.8.1.15)	Value of the source term [m^-3.s^-1]; Time-dependent; Array2D (nrho,nzimp)
integral	matflt_type (7.9.8.1.15)	Integral from 0 to rho of the source term. Time-dependent; Array2D(nrho,nzimp)
source	vecstring_type (7.9.8.1.20)	Source of the profile (any comment describing the origin of the impurity profiles : code, path to diagnostic signals, massaging, ...); Array of strings (nimp)

Type of: impurity_type:source_term (4369)

7.9.8.1.437 sourceion

Structure for the total source term for the transport equation (ions). Time-dependent;

member	type	description
value	matflt_type (7.9.8.1.15)	Value of the source term; Time-dependent; Matrix (nrho,nion)
integral	matflt_type (7.9.8.1.15)	Integral from 0 to rho of the source term. Time-dependent; Matrix (nrho,nion)
source	vecstring_type (7.9.8.1.20)	Source of the profile (any comment describing the origin of the profile : code, path to diagnostic signals, massaging, ...); Array of strings (nion)

Type of: corefieldion:source_term (4239)

7.9.8.1.438 species_desc

Description of a single ion species or bundled charge state.

member	type	description
label	string (7.9.8.1.4)	Name of species
amn	float (7.9.8.1.2)	Atomic mass number of the species
zn	float (7.9.8.1.2)	Nuclear charge of the impurity
zmin	float (7.9.8.1.2)	Minimum Z of species charge state bundle
zmax	float (7.9.8.1.2)	Maximum Z of species charge state bundle

Type of: edge:species (4144)

7.9.8.1.439 species_reference

Defines a reference to a single species in a CPO that includes a compositions structure.

member	type	description
type	identifier (7.9.8.1.263)	The type species: type.flag=1 for electron source; type.flag=2 for ion source taken from compositions/ions; type.flag=3 for impurity source taken from compositions/impur; 4=neutron source; 4=photon source etc (see species_reference_identifier_definition in the Documentation website under Conventions/Enumerated_datatypes).
index	integer (7.9.8.1.3)	Index of the species. This definition of index depends on the value of type; if the species is an ion (type.flag=1) or an impurity (type.flag=2) then the index refers to distribution/compositions/ions, or distribution/compositions/impur, respectively. This field has no meaning for other species, e.g. like electrons, neutrons or photons. The indexing follows the Fortran/Matlab convention where the first element in an array has index 1.

Type of: distri_vec:species (4297) I distsource_source:species (4302)

7.9.8.1.440 spectral

This structure accommodates the types needed on a spectral MSE diagnostic namely the emmissivity and the radiance spectra. It will be subsequenty upgraded with optical + photon detection elements since the structure will also be used for a synthetic spectral mse code.

member	type	description
emissivity	msediag_emissivity (7.9.8.1.305)	Emissivity characteristics.
radiance	msediag_radiance (7.9.8.1.308)	Emissivity characteristics.
codeparam	codeparam (7.9.8.1.105)	Code parameters

Type of: msediag:spectral (4157)

7.9.8.1.441 spectrum

Spectral properties of the wave.

member	type	description
phi_theta	launchs_phi_theta (7.9.8.1.275)	Power spectrum as a function of the refractive index in the toroidal and poloidal directions.
parallel	launchs_parallel (7.9.8.1.274)	Power spectrum as a function of the parallel refractive index.

Type of: launchs:spectrum (4153)

7.9.8.1.442 spot

Spot characteristics

member	type	description
size	vecflt_type (7.9.8.1.18)	Size of the spot ellipse [m], Vector (2). Time-dependent
angle	float (7.9.8.1.2)	Rotation angle for the spot ellipse [rd], Float. Time-dependent

Type of: rfbeam:spot (4488)

7.9.8.1.443 sputtering_neutrals

Sputtering coefficients

member	type	description
physical	vecflt_type (7.9.8.1.18)	Effective coefficient of physical sputtering of the neutral type INEUT. Vector(nneut). Time-dependent.
chemical	vecflt_type (7.9.8.1.18)	Effective coefficient of chemical sputtering of the neutral type INEUT. Vector(nneut). Time-dependent.

Type of: coefficients_neutrals:sputtering (4209)

7.9.8.1.444 straps

Properties of the IC antenna strap; Time-dependent; Vector(nstraps)

member	type	description
current	exp0D (7.9.8.1.224)	Root mean square current flowing along the strap [A]; Time-Dependent; Float
phase	exp0D (7.9.8.1.224)	Phase of strap current [rad]; Time-dependent; exp0D
phi_centre	float (7.9.8.1.2)	Toroidal angle at the centre of the strap [rad]; Float
width	float (7.9.8.1.2)	Width of strap in the toroidal direction [m]; Float
dist2wall	float (7.9.8.1.2)	Distance to conducting wall or other conducter behind the antenna straps [m]; Float
coord_strap	rz1D (7.9.8.1.387)	Coordinates (R,z) of polygon describing the antenna in the poloidal plane; rz1d vector (ncoord_strap)

Type of: antennaic_setup:straps (4183)

7.9.8.1.445 structure_cs

Detailed description of the coil structure, for coils that are part of the central solenoid.

member	type	description
gaptf	float (7.9.8.1.2)	gap between CS external radius and TF internal vault radius [m]; Scalar
ri	float (7.9.8.1.2)	CS internal radius [m]; Scalar
re	float (7.9.8.1.2)	CS external radius [m]; Scalar
jcable	float (7.9.8.1.2)	Maximum allowable CS Cable In Conduit current density [A/m^2]; Scalar
current_nom	float (7.9.8.1.2)	Nominal current in the CS conductor [A]; Scalar
sigma	float (7.9.8.1.2)	Maximum allowable stress in the CS [Pa]; Scalar

member	type	description
tiso	float (7.9.8.1.2)	Insulation thickness of CS conductor [m]; Scalar
nlay	float (7.9.8.1.2)	Number of conductor layers in the Central Solenoid; Scalar

Type of: desc_pfcoils:structure_cs (4269)

7.9.8.1.446 t_series_cplx

Time series

member	type	description
time_wind	vecflt_type (7.9.8.1.18)	Time trace [s]; Time-dependent; Vector (n)
values_re	vecflt_type (7.9.8.1.18)	Real part of data; Time-dependent; Vector (n)
values_im	vecflt_type (7.9.8.1.18)	Imaginary part of data; Time-dependent; Vector (n)

Type of: refl_receive:iq_receiver (4480)

7.9.8.1.447 t_series_real

Time series; Time-dependent

member	type	description
time_wind	vecflt_type (7.9.8.1.18)	Time trace [s]; Time-dependent; Vector (n)
values	vecflt_type (7.9.8.1.18)	Values of the sigal; Time-dependent; Vector (n)

Type of: refl_receive:io_signal (4480) I refl_receive:raw_signal (4480)

7.9.8.1.448 table

Stores the interpolation table (0d to 7d). Only one entry should be used.

member	type	description
filled	integer (7.9.8.1.3)	Identifier whether the tables have real data.
table_0d	float (7.9.8.1.2)	NO DOCS
table_1d	vecflt_type (7.9.8.1.18)	NO DOCS
table_2d	matflt_type (7.9.8.1.15)	NO DOCS
table_3d	array3dflt_type (7.9.8.1.7)	NO DOCS
table_4d	array4dflt_type (7.9.8.1.9)	NO DOCS
table_5d	array5dflt_type (7.9.8.1.10)	NO DOCS
table_6d	array6dflt_type (7.9.8.1.11)	NO DOCS
coord1_str	vecstring_type (7.9.8.1.20)	If needed, an array of strings describing coordinate 1
coord2_str	vecstring_type (7.9.8.1.20)	If needed, an array of strings describing coordinate 2
coord3_str	vecstring_type (7.9.8.1.20)	If needed, an array of strings describing coordinate 3
coord4_str	vecstring_type (7.9.8.1.20)	If needed, an array of strings describing coordinate 4
coord5_str	vecstring_type (7.9.8.1.20)	If needed, an array of strings describing coordinate 5
coord6_str	vecstring_type (7.9.8.1.20)	If needed, an array of strings describing coordinate 6
quality	identifier (7.9.8.1.263)	Characterize the data quality

Type of: tables:table (4552)

7.9.8.1.449 tables

Definition of a process

member	type	description
ndim	integer (7.9.8.1.3)	Table dimensionality of the process. Indicates which of the tables is filled.
coord_index	integer (7.9.8.1.3)	Index in tables_coord, specifying what coordinate specification to use for this table.
result_label	string (7.9.8.1.4)	Description of the process result (rate, cross section, sputtering yield, ...)
result_unit	string (7.9.8.1.4)	Unit of the process result
result_trans	integer (7.9.8.1.3)	Transformation of the process result. Integer flag: 0=no transformation; 1=10^; 2=exp()

member	type	description
zmin	vecint_type (7.9.8.1.19)	Minimum charge state [units of elementary charge]; if equal to zmax then no bundling; Vector(nchargestates)
zmax	vecint_type (7.9.8.1.19)	Maximum charge state [units of elementary charge]; if equal to zmin then no bundling; Vector(nchargestates)
state_label	vecstring_type (7.9.8.1.20)	Label for charge state (e.g. D0, D1+, ...); Vector(nchargestates)
table(:)	table (7.9.8.1.448)	Array of data tables, one entry per species. Vector(nchargestates)
data_source	string (7.9.8.1.4)	Filename or subroutine name used to provide this data.
data_provide	string (7.9.8.1.4)	ITM responsible person for this data.
data_citation	string (7.9.8.1.4)	Reference to publication(s).

Type of: amns:tables (4127)

7.9.8.1.450 tables_coord

Definition of coordinates for one specific coordinate system used in one or more tables.

member	type	description
coords(:)	coords (7.9.8.1.131)	Vector(ndim) of coordinates. ndim is number of parameters for a process.

Type of: amns:tables_coord (4127)

7.9.8.1.451 temporary_nt

set of non-timed temporary quantities

member	type	description
float0d(:)	temporary_nt_0dr (7.9.8.1.454)	Constant 0D float
integer0d(:)	temporary_nt_0di (7.9.8.1.453)	Constant 0D integer
complex0d(:)	temporary_nt_0dc (7.9.8.1.452)	Constant 0D complex
string0d(:)	temporary_nt_0ds (7.9.8.1.455)	Constant 0D string
float1d(:)	temporary_nt_1dr (7.9.8.1.458)	Constant 1D float
integer1d(:)	temporary_nt_1di (7.9.8.1.457)	Constant 1D integer
string1d(:)	temporary_nt_1dr (7.9.8.1.458)	Constant 1D string
complex1d(:)	temporary_nt_1dc (7.9.8.1.456)	Constant 1D complex
float2d(:)	temporary_nt_2dr (7.9.8.1.462)	Constant 2D float
integer2d(:)	temporary_nt_2di (7.9.8.1.461)	Constant 2D integer
complex2d(:)	temporary_nt_2dc (7.9.8.1.460)	Constant 2D complex
float3d(:)	temporary_nt_3dr (7.9.8.1.465)	Constant 3D float
integer3d(:)	temporary_nt_3di (7.9.8.1.464)	Constant 3D integer
complex3d(:)	temporary_nt_3dc (7.9.8.1.463)	Constant 3D complex
float4d(:)	temporary_nt_4dr (7.9.8.1.466)	Constant 4D float

Type of: temporary:non_timed (4171)

7.9.8.1.452 temporary_nt_0dc

a non-timed temporary quantity of complex type

member	type	description
identifier	identifier (7.9.8.1.263)	Identifier.

member	type	description
value	cplx_type (7.9.8.1.13)	Value. Complex scalar.

Type of: temporary_nt:complex0d (4554)

7.9.8.1.453 temporary_nt_0di

a non-timed temporary quantity of integer type

member	type	description
identifier	identifier (7.9.8.1.263)	Identifier.
value	integer (7.9.8.1.3)	Value. integer scalar

Type of: temporary_nt:integer0d (4554)

7.9.8.1.454 temporary_nt_0dr

a non-timed temporary quantity of real type

member	type	description
identifier	identifier (7.9.8.1.263)	Identifier.
value	float (7.9.8.1.2)	Value. Real scalar.

Type of: temporary_nt:float0d (4554)

7.9.8.1.455 temporary_nt_0ds

a non-timed temporary quantity of string type

member	type	description
identifier	identifier (7.9.8.1.263)	Identifier.
value	string (7.9.8.1.4)	Value. String.

Type of: temporary_nt:string0d (4554)

7.9.8.1.456 temporary_nt_1dc

a non-timed temporary quantity of veccomplex type

member	type	description
identifier	identifier (7.9.8.1.263)	Identifier.
value	veccplx_type (7.9.8.1.17)	Value. Vector of complex numbers

Type of: temporary_nt:complex1d (4554)

7.9.8.1.457 temporary_nt_1di

a non-timed temporary quantity of vecint type

member	type	description
identifier	identifier (7.9.8.1.263)	Identifier.
value	vecint_type (7.9.8.1.19)	Value. Vector of integers

Type of: temporary_nt:integer1d (4554)

7.9.8.1.458 temporary_nt_1dr

a non-timed temporary quantity of vecflt type

member	type	description
identifier	identifier (7.9.8.1.263)	Identifier.
value	vecflt_type (7.9.8.1.18)	Value. Vector of float.

Type of: temporary_nt:float1d (4554) I temporary_nt:string1d (4554)

7.9.8.1.459 temporary_nt_1ds

a non-timed temporary quantity of vecstring type

member	type	description
identifier	identifier (7.9.8.1.263)	Identifier.
value	vecstring_type (7.9.8.1.20)	Value. Vector of strings.

7.9.8.1.460 temporary_nt_2dc

a non-timed temporary quantity of matcomplex type

member	type	description
identifier	identifier (7.9.8.1.263)	Identifier.
value	matcplx_type (7.9.8.1.14)	Value. Matrix of complex numbers

Type of: temporary_nt:complex2d (4554)

7.9.8.1.461 temporary_nt_2di

a non-timed temporary quantity of matint type

member	type	description
identifier	identifier (7.9.8.1.263)	Identifier.
value	matint_type (7.9.8.1.16)	Value. Matrix of integers

Type of: temporary_nt:integer2d (4554)

7.9.8.1.462 temporary_nt_2dr

a non-timed temporary quantity of matflt type

member	type	description
identifier	identifier (7.9.8.1.263)	Identifier.
value	matflt_type (7.9.8.1.15)	Value. Matrix of float.

Type of: temporary_nt:float2d (4554)

7.9.8.1.463 temporary_nt_3dc

a non-timed temporary quantity of array3dcomplex type

member	type	description
identifier	identifier (7.9.8.1.263)	Identifier.
value	array3dcplx_type (7.9.8.1.6)	Value. array 3D of complex numbers

Type of: temporary_nt:complex3d (4554)

7.9.8.1.464 temporary_nt_3di

a non-timed temporary quantity of array3dint type

member	type	description

member	type	description
identifier	identifier (7.9.8.1.263)	Identifier.
value	array3dint_type (7.9.8.1.8)	Value. array 3D of integers

Type of: temporary_nt:integer3d (4554)

7.9.8.1.465 temporary_nt_3dr

a non-timed temporary quantity of array3dfloat type

member	type	description
identifier	identifier (7.9.8.1.263)	Identifier.
value	array3dflt_type (7.9.8.1.7)	Value. array 3D of floats

Type of: temporary_nt:float3d (4554)

7.9.8.1.466 temporary_nt_4dr

a non-timed temporary quantity of array4dfloat type

member	type	description
identifier	identifier (7.9.8.1.263)	Identifier.
value	array4dflt_type (7.9.8.1.9)	Value. array 4D of floats

Type of: temporary_nt:float4d (4554)

7.9.8.1.467 temporary_t

set of timed temporary quantities

member	type	description
float0d(:)	temporary_t_0dr (7.9.8.1.470)	Time-dependent 0D float
integer0d(:)	temporary_t_0di (7.9.8.1.469)	Time-dependent 0D integer.
complex0d(:)	temporary_t_0dc (7.9.8.1.468)	Time-dependent 0D complex.
string0d(:)	temporary_t_0ds (7.9.8.1.471)	Time-dependent 0D string.
float1d(:)	temporary_t_1dr (7.9.8.1.474)	Time-dependent 1D float.
integer1d(:)	temporary_t_1di (7.9.8.1.473)	Time-dependent 1D integer.
complex1d(:)	temporary_t_1dc (7.9.8.1.472)	Time-dependent 1D complex
float2d(:)	temporary_t_2dr (7.9.8.1.477)	Time-dependent 2D float
integer2d(:)	temporary_t_2di (7.9.8.1.476)	Time-dependent 2D integer
complex2d(:)	temporary_t_2dc (7.9.8.1.475)	Time-dependent 2D complex
float3d(:)	temporary_t_3dr (7.9.8.1.480)	Time-dependent 3D float
integer3d(:)	temporary_t_3di (7.9.8.1.479)	Time-dependent 3D integer
complex3d(:)	temporary_t_3dc (7.9.8.1.478)	Time-dependent 3D complex
float4d(:)	temporary_t_4dr (7.9.8.1.481)	Time-dependent 4D float

Type of: temporary:timed (4171)

7.9.8.1.468 temporary_t_0dc

a timed temporary quantity of complex type

member	type	description
identifier	identifier (7.9.8.1.263)	Identifier.
value	cplx_type (7.9.8.1.13)	Value. Time-dependent. Complex scalar.

Type of: temporary_t:complex0d (4570)

7.9.8.1.469 temporary_t_0di

a timed temporary quantity of integer type

member	type	description
identifier	identifier (7.9.8.1.263)	Identifier.
value	integer (7.9.8.1.3)	Value. Time-dependent. integer scalar

Type of: temporary_t:integer0d (4570)

7.9.8.1.470 temporary_t_0dr

a timed temporary quantity of real type

member	type	description
identifier	identifier (7.9.8.1.263)	Identifier.
value	float (7.9.8.1.2)	Value. Time-dependent. Real scalar.

Type of: temporary_t:float0d (4570)

7.9.8.1.471 temporary_t_0ds

a timed temporary quantity of string type

member	type	description
identifier	identifier (7.9.8.1.263)	Identifier.
value	string (7.9.8.1.4)	Value. Time-dependent. String.

Type of: temporary_t:string0d (4570)

7.9.8.1.472 temporary_t_1dc

a timed temporary quantity of veccomplex type

member	type	description
identifier	identifier (7.9.8.1.263)	Identifier.
value	veccplx_type (7.9.8.1.17)	Value. Time-dependent. Vector of complex numbers

Type of: temporary_t:complex1d (4570)

7.9.8.1.473 temporary_t_1di

a timed temporary quantity of vecint type

member	type	description
identifier	identifier (7.9.8.1.263)	Identifier.
value	vecint_type (7.9.8.1.19)	Value. Time-dependent. Vector of integers

Type of: temporary_t:integer1d (4570)

7.9.8.1.474 temporary_t_1dr

a timed temporary quantity of vecflt type

member	type	description
identifier	identifier (7.9.8.1.263)	Identifier.
value	vecflt_type (7.9.8.1.18)	Value. Time-dependent. Vector of float.

Type of: temporary_t:float1d (4570)

7.9.8.1.475 temporary_t_2dc

a timed temporary quantity of matcomplex type

member	type	description
identifier	identifier (7.9.8.1.263)	Identifier.
value	matcplx_type (7.9.8.1.14)	Value. Time-dependent. Matrix of complex numbers

Type of: temporary_t:complex2d (4570)

7.9.8.1.476 temporary_t_2di

a timed temporary quantity of matint type

member	type	description
identifier	identifier (7.9.8.1.263)	Identifier.
value	matint_type (7.9.8.1.16)	Value. Time-dependent. Matrix of integers

Type of: temporary_t:integer2d (4570)

7.9.8.1.477 temporary_t_2dr

a timed temporary quantity of matflt type

member	type	description
identifier	identifier (7.9.8.1.263)	Identifier.
value	matflt_type (7.9.8.1.15)	Value. Time-dependent. Matrix of float.

Type of: temporary_t:float2d (4570)

7.9.8.1.478 temporary_t_3dc

a timed temporary quantity of array3dcomplex type

member	type	description
identifier	identifier (7.9.8.1.263)	Identifier.
value	array3dcplx_type (7.9.8.1.6)	Value. Time-dependent. array 3D of complex numbers

Type of: temporary_t:complex3d (4570)

7.9.8.1.479 temporary_t_3di

a timed temporary quantity of array3dint type

member	type	description
identifier	identifier (7.9.8.1.263)	Identifier.
value	array3dint_type (7.9.8.1.8)	Value. Time-dependent. array 3D of integers

Type of: temporary_t:integer3d (4570)

7.9.8.1.480 temporary_t_3dr

a timed temporary quantity of array3dfloat type

member	type	description
identifier	identifier (7.9.8.1.263)	Identifier.
value	array3dflt_type (7.9.8.1.7)	Value. Time-dependent. array 3D of floats

Type of: temporary_t:float3d (4570)

7.9.8.1.481 temporary_t_4dr

a timed temporary quantity of array4dfloat type

member	type	description
identifier	identifier (7.9.8.1.263)	Identifier.
value	array4dflt_type (7.9.8.1.9)	Value. Time-dependent. array 4D of floats

Type of: temporary_t:float4d (4570)

7.9.8.1.482 tf_desc_tfcoils

Description of the toroidal field coils

member	type	description
type	integer (7.9.8.1.3)	Type of coil, 0=circular coil, 1=plane coil with arbitrary shape.
phi	float (7.9.8.1.2)	Toroidal angle of centre of coil 1, assuming all coils are identical and evenly distributed around the torus [rad]. Scalar
circularcoil	circularcoil (7.9.8.1.103)	Circular coil description
planecoil	planecoil (7.9.8.1.358)	Plane coil description
inboard	tf_structure (7.9.8.1.484)	Description of TF inboard structure
outboard	tf_structure (7.9.8.1.484)	Description of TF outboard structure

Type of: toroidfield:desc_tfcoils (4173)

7.9.8.1.483 tf_desc_tfcoils_board

Description of TF inboard/outboard properties

member	type	description
structure	tf_structure (7.9.8.1.484)	TF coil structure

7.9.8.1.484 tf_structure

Inner TF coil structure

member	type	description
jcable	float (7.9.8.1.2)	CICS cable in current density [A/m]; Scalar
tisotf	float (7.9.8.1.2)	Insulation thickness of TF conductor [m]; Scalar
efcasing	float (7.9.8.1.2)	Thickness front casing [m]; Scalar
escasing	float (7.9.8.1.2)	Thickness side casing [m]; Scalar
sigjackettf	float (7.9.8.1.2)	Jacket stress limit [Pa]; Scalar
sigvaulttf	float (7.9.8.1.2)	Vault stress limit [Pa]; Scalar
ktf	float (7.9.8.1.2)	Amplification factor for magnetic field
ritf	float (7.9.8.1.2)	Internal TF coil radius [m]; Scalar
riitf	float (7.9.8.1.2)	Internal vault TF coil radius [m]; Scalar
retf	float (7.9.8.1.2)	External TF coil radius [m]; Scalar
he_fraction	float (7.9.8.1.2)	Helium fraction (percentage) in TF structure infront of winding package [-]; Scalar
ss_fraction	float (7.9.8.1.2)	Stainless steel 316 fraction (percentage) in TF structure infront of winding package [-]; Scalar
pow_dens_wp	float (7.9.8.1.2)	Peak energy depostion in winding pack [W.m^-3]; Scalar

Type of: tf_desc_tfcoils:inboard (4585) I tf_desc_tfcoils:outboard (4585) I tf_desc_tfcoils_board:structure (4586)

7.9.8.1.485 theta_info

Information on the poloidal angle theta.

member	type	description
angl_type	integer (7.9.8.1.3)	Type of poloidal angle: 1 : same as the poloidal angle in the equlibrium cpo; 2 : geometrical polar angle, tan(theta) = Z/(R-R_0); 3 : other. If option 3, a transformation to the geometrical poloidal angle is provided in th2th_pol.
th2th_pol	matflt_type (7.9.8.1.15)	Geometrical poloidal angle at grid points in theta, i.e. the transformation from theta to the polar poloidal angle; used only if angl_type=3; Time-dependent; Matrix (ndim1, ndim2)

Type of: waves_grid_2d:theta_info (4631)

7.9.8.1.486 topo_regions

List with distribution function in each topological region; Time-dependent. Structure array(nregion_topo)

member	type	description
ind_omnigen	integer (7.9.8.1.3)	Index of the omnigeuous magnetic surfaces (generalised equitorial plane) to which the s-coordinates refer. NOTE: only used for gridcoord=3.
dim1	array6dflt_type (7.9.8.1.11)	First dimension in phase space; Time-dependent; Array6d(ndim11, ndim21, ndim31, ndim41, ndim51, ndim61).
dim2	array6dflt_type (7.9.8.1.11)	Second dimension in phase space; Time-dependent; Array6d(ndim12, ndim22, ndim32, ndim42, ndim52, ndim62).
dim3	array6dflt_type (7.9.8.1.11)	Third dimension in phase space; Time-dependent; Array6d(ndim13, ndim23, ndim33, ndim43, ndim53, ndim63).
dim4	array6dflt_type (7.9.8.1.11)	Fourth dimension in phase space; Time-dependent; Array6d(ndim14, ndim24, ndim34, ndim44, ndim54, ndim64).
dim5	array6dflt_type (7.9.8.1.11)	Fifth dimension in phase space; Time-dependent; Array6d(ndim15, ndim25, ndim35, ndim45, ndim55, ndim65).
dim6	array6dflt_type (7.9.8.1.11)	Sixth dimension in phase space; Time-dependent; Array6d(ndim16, ndim26, ndim36, ndim46, ndim56, ndim66).
jacobian	array6dflt_type (7.9.8.1.11)	Jacobian of the transformation of the phase space grid variables; Time-dependent; Array6d(ndim11, ndim22, ndim33, ndim44, ndim55, ndim66).
distfunc	array6dflt_type (7.9.8.1.11)	Orbit (or bounce) averaged distribution function given on a grid [1/m^3 (m/s)^-3]; Time-dependent; Array6d(ndim11, ndim22, ndim33, ndim44, ndim55, ndim66).

7.9.8.1.487 toroid_field

Toroidal field information entering the definition of rho_tor, for reference only. The physical value of the toroidal field should be taken from the toroidfield CPO. Time-dependent.

member	type	description
b0	float (7.9.8.1.2)	Vacuum field at r0 [T]; Time-dependent. Scalar.
b0prime	float (7.9.8.1.2)	Time derivative of the vacuum field at r0 [T/s]; Time-dependent. Scalar.
r0	float (7.9.8.1.2)	Characteristic major radius of the device (used in publications, usually middle of the vessel at the equatorial midplane) [m]. Scalar.
time	float (7.9.8.1.2)	Time [s] (exact time slice used from the time array of the source signal, here the toroidfield CPO. If the time slice does not exist in the time array of the source signal, it means linear interpolation has been used); Time-dependent; Scalar.

Type of: coreprof:toroid_field (4137)

7.9.8.1.488 trace

Position of particle in 5D space (3D in real and 2D in velocity).

member	type	description
time_orb	matflt_type (7.9.8.1.15)	Time along the orbit [s]; Time-dependent; Matrix (norbits, max_ntorb)
ntorb	vecint_type (7.9.8.1.19)	Number of time slices along the orbit, for each orbit. Time-dependent; Vector (norbits)
r	matflt_type (7.9.8.1.15)	Major radius of the guiding centre [m], Major radius; Time-dependent; Matrix (norbits, max_ntorb).
z	matflt_type (7.9.8.1.15)	Altitude of the guiding centre [m]; Time-dependent; Matrix (norbits, max_ntorb).
phi	matflt_type (7.9.8.1.15)	Toroidal angle of the guiding centre [rad]; Time-dependent; Matrix (norbits, max_ntorb).

member	type	description
psi	matflt_type (7.9.8.1.15)	Guiding centre position in psi [normalised poloidal flux]; Time-dependent; Matrix (norbits, max_ntorb)).
theta_b	matflt_type (7.9.8.1.15)	Position of the guiding centre in poloidal Boozer angle [rad]; Time-dependent; Matrix (norbits, max_ntorb).
v_parallel	matflt_type (7.9.8.1.15)	Parallel velocity along the orbit [m/s]; Time-dependent; Matrix (norbits, max_ntorb).
v_perp	matflt_type (7.9.8.1.15)	Perpendicular velocity along the orbit [m/s]; Time-dependent; Matrix (norbits, max_ntorb).

Type of: orbit:trace (4161)

7.9.8.1.489 transcoefel

Subtree containing transport coefficients from a transport model, for the electrons

member	type	description
diff_eff	vecflt_type (7.9.8.1.18)	Effective diffusivity [m^2.s^-1]. Time-dependent. Vector (nrho)
vconv_eff	vecflt_type (7.9.8.1.18)	Effective convection [m.s^-1]. Time-dependent. Vector (nrho)
flux	vecflt_type (7.9.8.1.18)	Flux. Not used in transport equations [field.m.s^-1,.m^-3 if field is not a density itself]. Time-dependent. Vector (nrho)
off_diagonal	offdiagel (7.9.8.1.329)	Details of the transport matrix, just for diagnostic (not used in transport equations). Time-dependent.
flag	integer (7.9.8.1.3)	Flag describing the form of transport produced by the original model : 0- not calculated, 1- D and V, 2- flux, 3- full transport matrix. Scalar.

Type of: coretransp_values:te_transp (4260) I neoclassic:mtor_neo (4159) I neoclassic:ne_neo (4159) I neoclassic:te_neo (4159)

7.9.8.1.490 transcoefimp

Subtree containing transport coefficients from a transport model, for the various impurity species (multiple charge states)

member	type	description
diff_eff	matflt_type (7.9.8.1.15)	Effective diffusivity [m^2.s^-1]. Time-dependent. Array2d (nrho,nzimp)
vconv_eff	matflt_type (7.9.8.1.15)	Effective convection [m.s^-1]. Time-dependent. Array2d (nrho,nzimp)
exchange	matflt_type (7.9.8.1.15)	Ion to electron energy exchange [W.m^-3]. Time-dependent. Array2d (nrho,nzimp)
flux	matflt_type (7.9.8.1.15)	Flux. Not used in transport equations [field.m.s^-1,.m^-3 if field is not a density itself]. Time-dependent. Array2d (nrho,nzimp)
flag	integer (7.9.8.1.3)	Flag describing the form of transport produced by the original model : 0- not calculated, 1- D and V, 2- flux, 3- full transport matrix (off-diagonal subtree not available for impurities for the moment). Scalar.

Type of: coretransp_values:nz_transp (4260) I coretransp_values:tz_transp (4260) I neoclassic:nz_neo (4159) I neoclassic:tz_neo (4159)

7.9.8.1.491 transcoefion

Subtree containing transport coefficients from a transport model, for the various ion species, including the energy exchange term qgi.

member	type	description
diff_eff	matflt_type (7.9.8.1.15)	Effective diffusivity [m^2.s^-1]. Time-dependent. Matrix (nrho,nion)
vconv_eff	matflt_type (7.9.8.1.15)	Effective convection [m.s^-1]. Time-dependent. Matrix (nrho,nion)
exchange	matflt_type (7.9.8.1.15)	Ion to electron energy exchange [W.m^-3]. Time-dependent. Matrix(nrho,nion).
qgi	matflt_type (7.9.8.1.15)	Energy exchange term due to transport. [W.m^-3]. Time-dependent. Matrix (nrho,nion)
flux	matflt_type (7.9.8.1.15)	Flux. Not used in transport equations [field.m.s^-1,.m^-3 if field is not a density itself]. Time-dependent. Matrix (nrho,nion)
off_diagonal	offdiagion (7.9.8.1.330)	Details of the transport matrix, just for diagnostic (not used in transport equations). Time-dependent.
flag	integer (7.9.8.1.3)	Flag describing the form of transport produced by the original model : 0- not calculated, 1- D and V, 2- flux, 3- full transport matrix. Scalar.

Type of: coretransp_values:ti_transp (4260) I neoclassic:ni_neo (4159) I neoclassic:ti_neo (4159)

7.9.8.1.492 transcoefvtor

Subtree containing transport coefficients from a transport model, for the various ion species

member	type	description
diff_eff	matflt_type (7.9.8.1.15)	Effective diffusivity [m^2.s^-1]. Time-dependent. Matrix (nrho,nion)
vconv_eff	matflt_type (7.9.8.1.15)	Effective convection [m.s^-1]. Time-dependent. Matrix (nrho,nion)
flux	matflt_type (7.9.8.1.15)	Flux. Not used in transport equations [field.m.s^-1,.m^-3 if field is not a density itself]. Time-dependent. Matrix (nrho,nion)
off_diagonal	offdiagion (7.9.8.1.330)	Details of the transport matrix, just for diagnostic (not used in transport equations). Time-dependent.
flag	integer (7.9.8.1.3)	Flag describing the form of transport produced by the original model : 0- not calculated, 1- D and V, 2- flux, 3- full transport matrix. Scalar.

Type of: coretransp_values:vtor_transp (4260)

7.9.8.1.493 trap_type

Definition of trap types. Array of structures (number of trap types)

member	type	description
trap_id	identifier (7.9.8.1.263)	Identifier for the trap type
compound	integer (7.9.8.1.3)	Index of the compound doing the trapping. Refers to (local) ../compounds.
gas_species	integer (7.9.8.1.3)	Index of the gas species being trapped. Refers to (local) ../gases.
energy	float (7.9.8.1.2)	Energy depth of the trap [eV]
fill_factor	matflt_type (7.9.8.1.15)	Discretized filling fraction of traps in this layer (0...1) [-]. Dimensions: 1. index: cell index of depth discretization in this layer; 2. index: number of discretization elements in the subgrid
density	matflt_type (7.9.8.1.15)	Discretized density of traps in this layer [1/m^3]. Dimensions: 1. index: cell index of depth discretization in this layer; 2. index: number of discretization elements in the subgrid

Type of: wall_unitsComplexType_layers:trap_type (4621)

7.9.8.1.494 trianglexyz

Triangular surface described by its three corners: point1, point2, and point3. The normal vector of this triangle is defined to be in the direction (point2-point1)x(point3-point1).

member	type	description
point1	xyz0D (7.9.8.1.537)	Point 1 on the triangle
point2	xyz0D (7.9.8.1.537)	Point 2 on the triangle
point3	xyz0D (7.9.8.1.537)	Point 3 on the triangle

Type of: nbi_nbi_unit_wall_surface:triangle (4416)

7.9.8.1.495 tsmeasure

Measured values (Thomson scattering)

member	type	description
te	exp1D (7.9.8.1.225)	Electron temperature [eV]. Vector (nchords)
ne	exp1D (7.9.8.1.225)	Electron density [m^-3]. Vector (nchords)

Type of: tsdiag:measure (4174)

7.9.8.1.496 tssetup

diagnostic setup information

member	type	description
position	rzphi1D (7.9.8.1.393)	Position of intersection between laser and line of sight; Vector (nchords)

Type of: tsdiag:setup (4174)

7.9.8.1.497 turbcomposition

Plasma composition (description of ion species).

member	type	description
amn	vecflt_type (7.9.8.1.18)	Atomic mass number (lumped ions are allowed); Vector (nion)
zn	vecflt_type (7.9.8.1.18)	Nuclear charge (lumped ions are allowed); Vector (nion)
zion	vecflt_type (7.9.8.1.18)	Ion charge (of the dominant ionisation state; lumped ions are allowed); Vector (nion)
ie_mass	vecflt_type (7.9.8.1.18)	Ion to electron mass ratio as used in the code for each species. To be used only by models which keep electron inertia. Vector (nion)

Type of: turbulence:composition (4175)

7.9.8.1.498 turbcoordsys

Decription of the coordinates and metric.

member	type	description
grid_type	string (7.9.8.1.4)	Type of coordinate system.
turbgrid	turbgrid (7.9.8.1.500)	Turbulence grid used by the codes; Time-dependent.
jacobian	matflt_type (7.9.8.1.15)	Jacobian of the coordinate system; Time-dependent; Matrix (ndim1, ndim2).
g_11	matflt_type (7.9.8.1.15)	metric coefficients g_11; Time-dependent; Matrix (ndim1, ndim2).
g_12	matflt_type (7.9.8.1.15)	metric coefficients g_12; Time-dependent; Matrix (ndim1, ndim2).
g_13	matflt_type (7.9.8.1.15)	metric coefficients g_13; Time-dependent; Matrix (ndim1, ndim2).
g_22	matflt_type (7.9.8.1.15)	metric coefficients g_22; Time-dependent; Matrix (ndim1, ndim2).
g_23	matflt_type (7.9.8.1.15)	metric coefficients g_23; Time-dependent; Matrix (ndim1, ndim2).
g_33	matflt_type (7.9.8.1.15)	metric coefficients g_33; Time-dependent; Matrix (ndim1, ndim2).
position	rzphi3D (7.9.8.1.397)	R Z phi positions of grid points; Time-dependent; Array3D (ndim1, ndim2, ndim3).

Type of: turbulence:coordsys (4175)

7.9.8.1.499 turbenv1d

Parallel fluctuation envelope.

member	type	description
theta	vecflt_type (7.9.8.1.18)	Straight field line poloidal angle [rad]; Vector (ntheta_env).
phi	vecflt_type (7.9.8.1.18)	Electrostatic potential [V^2]; Time-dependent; Vector (ntheta_env).
vor	vecflt_type (7.9.8.1.18)	Vorticity [coulomb^2/m^6]; Time-dependent; Vector (ntheta_env).
jpl	vecflt_type (7.9.8.1.18)	Parallel current [A^2/m^4]; Time-dependent; Vector (ntheta_env).
ne	vecflt_type (7.9.8.1.18)	Electron density [m^-6]; Time-dependent; Vector (ntheta_env).
he	vecflt_type (7.9.8.1.18)	Nonadiabatic electron density [m^-6]; Time-dependent; Vector (ntheta_env).
te	vecflt_type (7.9.8.1.18)	Electron temperature [eV^2]; Time-dependent; Vector (ntheta_env).
ni	matflt_type (7.9.8.1.15)	Ion density [m^-6]; Time-dependent; Matrix(ntheta_env,nion).
ti	matflt_type (7.9.8.1.15)	Ion temperature [eV^2]; Time-dependent; Matrix(ntheta_env,nion).
ui	matflt_type (7.9.8.1.15)	Ion parallel velocity [m^2/s^2]; Time-dependent; Matrix (ntheta_env,nion).
fe	vecflt_type (7.9.8.1.18)	Electron particle flux [m^-2/s per mode]; Time-dependent; Vector (ntheta_env).
qe	vecflt_type (7.9.8.1.18)	Electron conductive heat flux [W.m^-2 per mode]; Time-dependent; Vector (ntheta_env).
qi	matflt_type (7.9.8.1.15)	Ion conductive heat flux [W. m^-2 per mode]; Time-dependent; Matrix(ntheta_env,nion).
me	vecflt_type (7.9.8.1.18)	Magnetic electron heat flux [W.m^-2 per mode]; Time-dependent; Vector (ntheta_env).
mi	matflt_type (7.9.8.1.15)	Magnetic ion heat flux [W. m^-2 per mode]; Time-dependent; Matrix(ntheta_env,nion).

Type of: turbulence:env1d (4175)

7.9.8.1.500 turbgrid

Generic structure for a turbulence grid.

member	type	description
dim1	vecflt_type (7.9.8.1.18)	First dimension values; Vector (ndim1).
dim2	vecflt_type (7.9.8.1.18)	Second dimension values; Vector (ndim2).
dim3	vecflt_type (7.9.8.1.18)	Third dimension values; Vector (ndim3).

member	type	description
dim_v1	vecflt_type (7.9.8.1.18)	First v-space dimension values; Vector (ndim_v1).
dim_v2	vecflt_type (7.9.8.1.18)	Second v-space dimension values; Vector (ndim_v2).

Type of: turbcoordsys:turbgrid (4601)

7.9.8.1.501 turbspec1d

Perpendicular wavenumber spectra.

member	type	description
kperp	vecflt_type (7.9.8.1.18)	Perpendicular wavenumber [m^-1]; Vector (ndim_spec).
phi	vecflt_type (7.9.8.1.18)	Electrostatic potential [V^2 per mode]; Time-dependent; Vector (ndim_spec).
vor	vecflt_type (7.9.8.1.18)	Vorticity [s^-2 per mode]; Time-dependent; Vector (ndim_spec).
b	vecflt_type (7.9.8.1.18)	Magnetic energy [T^2 per mode]; Time-dependent; Vector (ndim_spec).
jpl	vecflt_type (7.9.8.1.18)	Current [A^2/m^4 per mode]; Time-dependent; Vector (ndim_spec).
ne	vecflt_type (7.9.8.1.18)	Electron density [m^-6 per mode]; Time-dependent; Vector (ndim_spec).
te	vecflt_type (7.9.8.1.18)	Electron temperature [eV^2 per mode]; Time-dependent; Vector (ndim_spec).
ti	matflt_type (7.9.8.1.15)	Ion temperature [eV^2 per mode]; Time-dependent; Matrix (ndim_spec,nion).
fe	vecflt_type (7.9.8.1.18)	Electron particle flux [m^-2/s per mode]; Time-dependent; Vector (ndim_spec).
qe	vecflt_type (7.9.8.1.18)	Electron conductive heat flux [W.m^-2 per mode]; Time-dependent; Vector (ndim_spec).
qi	matflt_type (7.9.8.1.15)	Ion conductive heat flux [W.m^-2 per mode]; Time-dependent; Matrix(ndim_spec,nion).
me	vecflt_type (7.9.8.1.18)	Magnetic electron heat flux [W.m^-2 per mode]; Time-dependent; Matrix (ndim_spec).
mi	matflt_type (7.9.8.1.15)	Magnetic ion heat flux [W.m^-2 per mode]; Time-dependent; Matrix (ndim_spec,nion).

Type of: turbulence:spec1d (4175)

7.9.8.1.502 turbvar0d

Time traces.

member	type	description
dtime_type	string (7.9.8.1.4)	Description of time trace e.g. last ndtime points.
dtime	vecflt_type (7.9.8.1.18)	Fast diagnostic time [s]; Time-dependent; Vector (ndtime).
en_exb	vecflt_type (7.9.8.1.18)	ExB energy [J/m^3]; Time-dependent; Vector (ndtime).
en_mag	vecflt_type (7.9.8.1.18)	Magnetic energy [J/m^3]; Time-dependent; Vector (ndtime).
en_el_th	vecflt_type (7.9.8.1.18)	electron thermal energy or free energy [J/m^3]; Time-dependent.
en_ion_th	matflt_type (7.9.8.1.15)	Ion thermal energy or free energy [J/m^3]; Time-dependent; Matrix (ndtime, nion).
en_el_par	vecflt_type (7.9.8.1.18)	Electron parallel energy [J/m^3]; Time-dependent; Vector (ndtime).
en_ion_par	matflt_type (7.9.8.1.15)	Ion parallel energy [J/m^3]; Time-dependent; Matrix (ndtime,nion).
en_tot	vecflt_type (7.9.8.1.18)	Total energy or free energy [J/m^3]; Time-dependent; Vector (ndtime).
fl_el	vecflt_type (7.9.8.1.18)	Electron flux [m^-2 s^-1]; Time-dependent; Vector (ndtime).
fl_heatel	vecflt_type (7.9.8.1.18)	Conductive electron heat flux [W.m^-2]; Time-dependent; Vector (ndtime).
fl_ion	matflt_type (7.9.8.1.15)	Ion flux [m^-2 s^-1]; Time-dependent; Matrix (ndtime, nion).
fl_heation	matflt_type (7.9.8.1.15)	Conductive ion heat flux [W.m^-2]; Time-dependent; Matrix (ndtime, nion).
fl_magel	vecflt_type (7.9.8.1.18)	Electron flux [m^-2 s^-1]; Time-dependent; Vector (ndtime).
fl_magheatel	vecflt_type (7.9.8.1.18)	Conductive electron heat flux [W.m^-2]; Time-dependent; Vector (ndtime).
fl_magion	matflt_type (7.9.8.1.15)	Ion flux [m^-2 s^-1]; Time-dependent; Matrix (ndtime, nion).
flmagheation	matflt_type (7.9.8.1.15)	Conductive ion heat flux [W.m^-2]; Time-dependent; Matrix (ndtime, nion).

Type of: turbulence:var0d (4175)

7.9.8.1.503 turbvar1d

Dependent variable zonal average radial profile.

member	type	description
rho_tor_norm	vecflt_type (7.9.8.1.18)	Normalised toroidal flux coordinate. Vector(nrho1d)
phi	vecflt_type (7.9.8.1.18)	Electrostatic potential [V]; Time-dependent; Vector (nrho1d).
er	vecflt_type (7.9.8.1.18)	Radial electric field [V/m]; Time-dependent; Vector (nrho1d).
vor	vecflt_type (7.9.8.1.18)	Vorticity [s^-1]; Time-dependent; Vector (nrho1d).

member	type	description
apl	vecflt_type (7.9.8.1.18)	Parallel magnetic potential divided by B [m]; Time-dependent; Vector (nrho1d).
jpl	vecflt_type (7.9.8.1.18)	Parallel current divided by B [A/m^2 per T]; Time-dependent; Vector (nrho1d).
ne	vecflt_type (7.9.8.1.18)	Electron density [m^-3]; Time-dependent; Vector (nrho1d).
te	vecflt_type (7.9.8.1.18)	Electron temperature [eV]; Time-dependent; Vector (nrho1d).
ni	matflt_type (7.9.8.1.15)	Ion density [m^-3]; Time-dependent; Matrix (nrho1d,nion).
ti	matflt_type (7.9.8.1.15)	Ion temperature [eV]; Time-dependent; Matrix (nrho1d,nion).
ui	matflt_type (7.9.8.1.15)	Ion parallel velocity divided by B [m/s per T]; Time-dependent; Matrix (nrho1d,nion).

Type of: turbulence:var1d (4175)

7.9.8.1.504 turbvar2d

Dependent variable axisymmetric component.

member	type	description
rho_tor_norm	vecflt_type (7.9.8.1.18)	Normalised toroidal flux coordinate. Vector(nrho2d)
theta	vecflt_type (7.9.8.1.18)	Straight field line poloidal angle angle [rad]. Vector(ntheta2d)
phi	matflt_type (7.9.8.1.15)	Electrostatic potential [V]; Time-dependent; Matrix (nrho2d,ntheta2d).
apl	matflt_type (7.9.8.1.15)	Parallel magnetic potential divided by B [m]; Time-dependent; Matrix(nrho2d,ntheta2d).
jpl	matflt_type (7.9.8.1.15)	Parallel current divided by B [A/m^2 per T]; Time-dependent; Matrix (nrho2d,ntheta2d).
vor	matflt_type (7.9.8.1.15)	Vorticity [s^-1]; Time-dependent; Matrix(nrho2d,ntheta2d).
ne	matflt_type (7.9.8.1.15)	Electron density [m^-3]; Time-dependent; Matrix (nrho2d,ntheta2d).
te	matflt_type (7.9.8.1.15)	Electron temperature [eV]; Time-dependent; Matrix (nrho2d,ntheta2d).
ni	array3dflt_type (7.9.8.1.7)	Ion density [m^-3]; Time-dependent; Array3D (nrho2d,ntheta2d,nion).
ti	array3dflt_type (7.9.8.1.7)	Ion temperature [eV]; Time-dependent; Array3D (nrho2d,ntheta2d,nion).
ui	array3dflt_type (7.9.8.1.7)	Ion parallel velocity divided by B [m/s per T]; Time-dependent; Array3D(nrho2d,ntheta2d,nion).

Type of: turbulence:var2d (4175)

7.9.8.1.505 turbvar3d

Dependent variable morphology (on the internal grid code coord_sys/turbgrid).

member	type	description
phi	array3dflt_type (7.9.8.1.7)	Electrostatic potential [V]; Time-dependent; Array3D(ndim1,ndim2,ndim3).
vor	array3dflt_type (7.9.8.1.7)	Vorticity [s^-1]; Time-dependent; Array3D(ndim1,ndim2,ndim3).
jpl	array3dflt_type (7.9.8.1.7)	Parallel current [A/m^2]; Time-dependent; Array3D(ndim1,ndim2,ndim3).
ne	array3dflt_type (7.9.8.1.7)	Electron density [m^-3]; Time-dependent; Array3D(ndim1,ndim2,ndim3).

Type of: turbulence:var3d (4175)

7.9.8.1.506 turbvar4d

Gyrokinetic distribution function, axisymmetric component. Grid is defined in coord_sys/turbgrid.

member	type	description
fe	array4dflt_type (7.9.8.1.9)	Electron distribution function times V-space volume element, axisymmetric component [m^-3]; Time-dependent; Array4D(ndim1,ndim2,ndim3,ndim_v1).
fi	array5dflt_type (7.9.8.1.10)	Ion distribution function times V-space volume element, axisymmetric component [m^-3]; Time-dependent; Array5D(ndim1,ndim2,ndim3,ndim_v1,nion).

Type of: turbulence:var4d (4175)

7.9.8.1.507 turbvar5d

Gyrokinetic distribution function. Grid is defined in coord_sys/turbgrid.

member	type	description
fe	array5dflt_type (7.9.8.1.10)	Electron distribution function times V-space volume element [m^-3]; Time-dependent; Array5D(ndim1,ndim2,ndim3,ndim_v1,ndim_v2).

member	type	description
fi	array6dflt_type (7.9.8.1.11)	Ion distribution function times V-space volume element [m^-3]; Time-dependent; Array6D(ndim1,ndim2,ndim3,ndim_v1,ndim_v2,nion).

Type of: turbulence:var5d (4175)

7.9.8.1.508 version_ind

Array of available releases/versions of the AMNS data; each element contains information about the AMNS data that is included in the release. This part of the CPO is filled and stored only into shot/run=0/1, playing the role of a catalogue.

member	type	description
description	vecstring_type (7.9.8.1.20)	Description of each version.
releasedate	string (7.9.8.1.4)	Release date
data_release(:)	data_release (7.9.8.1.161)	For this release, an array over each data item (i.e. shot/run pair containing the actual data) included in this release

Type of: amns:version_ind (4127)

7.9.8.1.509 wall2d

A 2D wall type; Structure array. Replicate this element for each type of possible physics configurations necessary (gas tight vs wall with ports and holes)

member	type	description
wall_id	identifier (7.9.8.1.263)	Use this identifier to tag the type of 2d wall you are using. Use 0 for equilibrium codes (single closed limiter and vessel); 1 for gas-tight walls (disjoint PFCs with inner vessel as last limiter_unit; no vessel structure); 2 for free boundary codes (disjoint PFCs and vessel)
limiter	wall_limiter (7.9.8.1.514)	Description of the immobile limiting surface(s) or plasma facing components for defining the Last Closed Flux Surface. Two representations are admitted : single contour or disjoint PFC. The limiter_id identifies the type of limiter set and code-specific representations derived from the official ones are also allowed if documented. Array of structures (nlimiter_type). Time-dependent
vessel	wall_vessel (7.9.8.1.519)	Mechanical structure of the vacuum vessel. Vessel assumed as set of nested layers with given physics properties; Two representations are admitted for each vessel unit : annular (two contours) or blocks. The vessel_id identifies the type of vessel_unit set one is using and code-specific representations derived from the official ones are also allowed if documented. Array of structures (nvessel_type)
plasma(:)	plasmaComplexType (7.9.8.1.359)	Description of incoming plasma for every wall component. Array of structures (number of wall components). The geometry of the wall component with index i is given by the limiter unit with index i in wall/wall2d/limiter/limiter_unit. Time-dependent
wall_state(:)	wall_unitsComplexType (7.9.8.1.517)	Dynamic wall state of every wall component. Array of structures (number of wall components). The geometry of the wall component with index i is given by the limiter unit with index i in wall/wall2d/limiter/limiter_unit. Time-dependent

Type of: wall:wall2d (4176)

7.9.8.1.510 wall2d_mhd

Simplified wall that encloses necessary information for RWM codes.

member	type	description
res_wall(:)	mhd_res_wall2d (7.9.8.1.294)	Resistive Wall(s).
ideal_wall	mhd_ideal_wall2d (7.9.8.1.291)	Ideal wall

Type of: wall:wall2d_mhd (4176)

7.9.8.1.511 wall3d

3D wall descriptions; Array of structures (number of wall descriptions). Replicate this element for each type of possible physics or engineering configurations necessary (gas tight vs wall with ports and holes, coarse vs fine representation, ...). Time-dependent

member	type	description

member	type	description
wall_id	identifier (7.9.8.1.263)	Identify the type of wall - 0 for gas tight and 1 for a wall with holes/open ports
grid	complexgrid (7.9.8.1.110)	Grid description
plasma(:)	plasmaComplexType (7.9.8.1.359)	Description of incoming plasma for every wall component. Array of structures (number of wall components). The geometry of the wall component with index i is given by the corresponding subgrid with index i in wall/wall3d/grid. Time-dependent
wall_state(:)	wall_unitsComplexType (7.9.8.1.517)	Dynamic wall state of every wall component. Array of structures (number of wall components). The geometry of the wall component with index i is given by the corresponding subgrid with index i in wall/wall3d/grid. Time-dependent
basis_index	integer (7.9.8.1.3)	Index of basis vectors in wall/wall3d/grid/basis used to define vector quantities e.g. in plasma.

Type of: wall:wall3d (4176)

7.9.8.1.512 wall_blocks

Vector of vacuum vessel units. Replicate this vessel_unit element ncomponents times. Each unit contains a mechanical structure of the vessel with distinct physics properties. Array of structures (ncomponents)

member	type	description
blocks_unit(:)	wall_blocks_unit (7.9.8.1.513)	Vector of blocks that build of the vessel layer. Replicate this element nblocks times. Each unit contains a building block of the vessel and can have dedicated number of points. Array of structures (nblocks)

Type of: wall_vessel_unit:blocks (4624)

7.9.8.1.513 wall_blocks_unit

Vector of blocks that build of the vessel layer. Replicate this element nblocks times. Each unit contains a building block of the vessel and can have dedicated number of points. Array of structures (nblocks)

member	type	description
name	string (7.9.8.1.4)	Name or description of the blocks_unit
position	rz1D (7.9.8.1.387)	Position (R,Z coordinates) of a vessel segment. No need to repeat first point for closed contours [m]; Vector(npoints)
eta	float (7.9.8.1.2)	Resistivity of the vessel segment [ohm.m]; Scalar
permeability	float (7.9.8.1.2)	Vessel relative permeability; Scalar
j_phi	float (7.9.8.1.2)	induced currents inside the vessel; time dependent; [A]
resistance	float (7.9.8.1.2)	resistance of block; [Ohm]

Type of: wall_blocks:blocks_unit (4615)

7.9.8.1.514 wall_limiter

Description of the immobile limiting surface(s) or plasma facing components for defining the Last Closed Flux Surface. Two representations are admitted : single contour or disjoint PFC. The limiter_id identifies the type of limiter set and code-specific representations derived from the official ones are also allowed if documented. Array of structures (nlimiter_type)

member	type	description
limiter_id	identifier (7.9.8.1.263)	Use this identifier to tag the type of limiter you are using. Use flag=0 for the official single contour limiter and 1 for the official disjoint PFC structure like first wall. Additional representations needed on a code-by-code basis follow same incremental pair tagging starting on flag=2
limiter_unit(:)	limiter_unit (7.9.8.1.280)	Array of ncomponents limiting surfaces making up the limiter type (single contour or disjoint PFC). Replicate this limiter_unit element ncomponents times. Each unit contains a plasma facing component that can have dedicated number of points. Array of structures (ncomponents). Time-dependent

Type of: wall2d:limiter (4612)

7.9.8.1.515 wall_types

Reference wall type

member	type	description
label	string (7.9.8.1.4)	Label for this reference wall type
layers(:)	wall_types_layers (7.9.8.1.516)	Engineering layers composing the wall element; array of structures (number of engineering layers). First layer is facing the plasma, increasing index means moving away from the plasma facing surface

Type of: wall:wall_types (4176)

7.9.8.1.516 wall_types_layers

Engineering layers composing the wall element; array of structures (number of engineering layers). First layer is facing the plasma, increasing index means moving away from the plasma facing surface

member	type	description
thickness	float (7.9.8.1.2)	Thickness of layer [m]
chem_comp	vecflt_type (7.9.8.1.18)	Chemical composition of the layer in terms of the chemical compounds defined in wall/design_comp/compounds. Vector of fractional concentrations.

Type of: wall_types:layers (4618)

7.9.8.1.517 wall_unitsComplexType

Data for individual wall elements; Time-dependent

member	type	description
wall_type	integer (7.9.8.1.3)	Definition of reference wall composition for every subgrid of the wall discretization. Vector of integers (number of subgrids). The indices point to wall/wall_types.
n_depo_layer	integer (7.9.8.1.3)	Number of deposited layers (in addition to the engineering layers)
layers(:)	wall_unitsComplexType_layers (7.9.8.1.518)	Data on wall element layers; Array of structures (number of engineering layers + number of deposited layers); Layers can possibly be void (e.g. completely eroded), which is indicated by zero thickness. Time-dependent
eta	complexgrid_scalar (7.9.8.1.115)	Resitivity of wall element described by grid geometry [Ohm.m]
permeability	complexgrid_scalar (7.9.8.1.115)	Relative permeability of wall element described by grid geometry [-]
j	complexgrid_vector (7.9.8.1.121)	Current density vector in the element specified by the grid representation. [A/m^2]

Type of: wall2d:wall_state (4612) I wall3d:wall_state (4614)

7.9.8.1.518 wall_unitsComplexType_layers

Data on wall element layers; Array of structures (number of engineering layers + number of deposited layers); Layers can possibly be void (e.g. completely eroded), which is indicated by zero thickness. Time-dependent

member	type	description
elements	vecint_type (7.9.8.1.19)	List of elements present in the solid phase in this layer. Vector (number of elements). Holds indices pointing to wall/elements
gases	vecint_type (7.9.8.1.19)	List of gases present in this layer. Vector (number of gases). Holds indices pointing to wall/elements
compounds	vecint_type (7.9.8.1.19)	List of compounds present in the solid phase in this layer. Vector (number of compounds). Holds indices pointing to wall/compounds
density	matflt_type (7.9.8.1.15)	Discretized density distribution in the layer of the discrete wall elements in the subgrid [kg/m^3]; Time-dependent; Float matrix (number of vertical cells in layer, number of discretization elements in the subgrid)
dx	matflt_type (7.9.8.1.15)	Size of the vertical cells in the layer of the discrete wall elements in the subgrid [kg/m^3]; Time-dependent; Float matrix (number of vertical cells in layer, number of discretization elements in the subgrid)
thickness	vecflt_type (7.9.8.1.18)	Total size of the layer [m] (i.e. sum of dx over the number of vertical cells in the layer); Time-dependent; Vector (number of discretization elements in the subgrid)
roughness	array3dflt_type (7.9.8.1.7)	Interface roughness description between the discrete elements and their top neighbour (i.e. towards the plasma); Time-dependent; Float 3d array (number of vertical cells in layer, number of discretization elements in the subgrid, index of roughness parameter); Roughness parameter 1: RMS height [m], parameter 2: wavelength along projection of B on the surface [m], parameter 3: wavelength perpendicular to projection of B on the surface [m]. If only two parameters are given the parameters are assumed to be isotropic

member	type	description
porosity	array3dflt_type (7.9.8.1.7)	Discrete description of porosity of the layer. Time-dependent; Float 3d array (number of vertical cells in layer, number of discretization elements in the subgrid, index of porosity parameter); Porosity parameter 1: Volume fraction occupied by the pores [-], parameter 2: average size of the pores [m]
dpa	matflt_type (7.9.8.1.15)	Discretized number of displacements per atom in the layer of the discrete wall elements in the subgrid [-]; Time-dependent; Float matrix (number of vertical cells in layer, number of discretization elements in the subgrid)
temperature	matflt_type (7.9.8.1.15)	Discretized temperature distribution in the layer of the discrete wall elements in the subgrid [eV]; Time-dependent; Float matrix (number of vertical cells in layer, number of discretization elements in the subgrid)
element_frac	array3dflt_type (7.9.8.1.7)	Fractional abundance of elements in the layer of the discrete wall elements in the subgrid [-]; Time-dependent; Float matrix (number of chemical elements as given in (local) elements, number of vertical cells in layer, number of discretization elements in the subgrid)
chem_comp	array3dflt_type (7.9.8.1.7)	Fractional abundance of chemical compounds in the layer of the discrete wall elements in the subgrid [-]; Time-dependent; Float matrix (number of chemical compounds as given in (local) compounds, number of vertical cells in layer, number of discretization elements in the subgrid)
bulk_D	array4dflt_type (7.9.8.1.9)	Diffusivity of gas species in bulks of different compounds [m^2/s]; Time-dependent; 4d float array. Dimensions: 1. index of compound (indexing as in (local) compounds), 2. index of gas element (indexing as in (local) gases), 3. cell index of 1d layer height discretization, 4. number of discretization elements in the subgrid
surface_D	array4dflt_type (7.9.8.1.9)	Diffusivity of hydrogen species of surface of different compounds [m^2/s]; Time-dependent; Dimensions: see bulk_D
bulk_solute	array4dflt_type (7.9.8.1.9)	Bulk mobile (solute) concentration [atoms/m^3]; Time-dependent; Dimensions: see bulk_D
surf_solute	array4dflt_type (7.9.8.1.9)	Surface mobile (solute) concentration [atoms/m^2]; Time-dependent; Dimensions: see bulk_D
pore_content	array3dflt_type (7.9.8.1.7)	Amount of gas species trapped in pores per cubic meter [1/m^3]; Time-dependent; 3d float array. Dimensions: 1. index of gas element (indexing as in (local) gases), 2. cell index of 1d layer height discretization, 3. number of discretization element in the subgrid
trap_type(:)	trap_type (7.9.8.1.493)	Definition of trap types. Array of structures (number of trap types)

Type of: wall_unitsComplexType:layers (4620)

7.9.8.1.519 wall_vessel

Mechanical structure of the vacuum vessel. Vessel assumed as set of nested layers with given physics properties; Two representations are admitted for each vessel unit : annular (two contours) or blocks. The vessel_id identifies the type of vessel_unit set one is using and code-specific representations derived from the official ones are also allowed if documented. Array of structures (nvessel_type)

member	type	description
vessel_id	identifier (7.9.8.1.263)	Use this identifier to tag the type of vessel you are using. Use flag=0 for the official single/multiple annular vessel and 1 for the official block element representation for each vessel unit. Additional representations needed on a code-by-code basis follow same incremental pair tagging starting on flag=2
vessel_unit(:)	wall_vessel_unit (7.9.8.1.521)	Array of vacuum vessel units. Replicate this vessel_unit element ncomponents times. Each unit contains a mechanical structure of the vessel with distinct physics properties. Array of structures (ncomponents)

Type of: wall2d:vessel (4612)

7.9.8.1.520 wall_vessel_annular

Vector of vacuum vessel units. Replicate this vessel_unit element ncomponents times. Each unit contains a mechanical structure of the vessel with distinct physics properties. Array of structures (ncomponents)

member	type	description
name	string (7.9.8.1.4)	Name or description of the vessel_unit
inside	rz1D (7.9.8.1.387)	Inner Vessel wall outline (list of R,Z co-ordinates) [m]; Vector (npoints_inner)
outside	rz1D (7.9.8.1.387)	Outer Vessel wall outline (list of R,Z co-ordinates) [m]; Vector (npoints_outer)
eta	float (7.9.8.1.2)	Vessel resistivity [ohm.m]; Scalar
permeability	float (7.9.8.1.2)	Vessel relative permeability; Scalar

Type of: wall_vessel_unit:annular (4624)

7.9.8.1.521 wall_vessel_unit

Vector of vacuum vessel units. Replicate this vessel_unit element ncomponents times. Each unit contains a mechanical structure of the vessel with distinct physics properties. Array of structures (ncomponents)

member	type	description
annular	wall_vessel_annular (7.9.8.1.520)	Annular representation of a vessel layer by two free-hand contours.
blocks	wall_blocks (7.9.8.1.512)	Block element representation of vessel units. Each vessel unit is decomposed in elementary small units (blocks) caracyerized by a position, resistivity and relative permeability.
radial_build	wall_wall2d_vessel_radial_build (7.9.8.1.524)	Simple description of this vessel unit for the radial_build in system codes

Type of: wall_vessel:vessel_unit (4622)

7.9.8.1.522 wall_wall0d

Simple 0D description of plasma-wall interaction

member	type	description
pumping_speed	vecflt_type (7.9.8.1.18)	pumping speed; Time-dependent. vector(nneut); [particles/s]
gas_puff	vecflt_type (7.9.8.1.18)	gas puff; vector(nneut); Time-dependent. [particles/s]
wall_inventory	vecflt_type (7.9.8.1.18)	wall inventory; vector(nneut); Time-dependent. [particles]
recycling_coefficient	vecflt_type (7.9.8.1.18)	Recycling coefficient. Vector(nneut) Time-dependent.
wall_temperature	float (7.9.8.1.2)	Wall temperature [K]. Time-dependent. Scalar
power_from_plasma	float (7.9.8.1.2)	Power flowing from the plasma to the wall [W]. Time-dependent. Scalar
power_to_cooling	float (7.9.8.1.2)	Power to cooling systems [W]. Time-dependent. Scalar
plasma	wall_wall0d_plasma (7.9.8.1.523)	NO DOCS

Type of: wall:wall0d (4176)

7.9.8.1.523 wall_wall0d_plasma

member	type	description
species_index	matint_type (7.9.8.1.16)	Index of species into wall/compositions; matrix(nspecies,3); 1st element indicates {1: main ions; 2:impurities; 3:neutrals; 4:edge species); 2nd element indicates index into that array; 3rd index indicates charge state if 1st element points to inpurities or neutral type if 1st element points to neutrals;
flux	vecflt_type (7.9.8.1.18)	flux of species indicated by species_index; array of nspecies; positive implies incoming onto wall; negative implies sent back into plasma; time-dependent; [particles/s]
energy	vecflt_type (7.9.8.1.18)	energy flux of species indicated by species_index; array of nspecies; positive implies incoming onto wall; negative implies sent back into plasma; time-dependent; [W]

Type of: wall_wall0d:plasma (4625)

7.9.8.1.524 wall_wall2d_vessel_radial_build

Simple description of this vessel unit for the radial_build in system codes

member	type	description
r1_inb	float (7.9.8.1.2)	Inner radius (nearest to the plasma), in the global tokamak coordinate system of the vv measured at the equatorial plane (inboard side) [m]; Scalar
r2_inb	float (7.9.8.1.2)	Outer radius (farest from the plasma), in the global tokamak coordinate system of the vv measured at the equatorial plane (inboard side) [m]; Scalar
r1_outb	float (7.9.8.1.2)	Inner radius (nearest to the plasma), in the global tokamak coordinate system of the vv measured at the equatorial plane (outboard side) [m]; Scalar
r2_outb	float (7.9.8.1.2)	Outer radius (farest from the plasma), in the global tokamak coordinate system of the vv measured at the equatorial plane (outboard side) [m]; Scalar
raddim	float (7.9.8.1.2)	Radial thickness of the vacuum vessel; Scalar
nmat	float (7.9.8.1.2)	Number of materials; Scalar
composition	vecflt_type (7.9.8.1.18)	Inboard shield radial build giving the percentage of each material respectively (Meaning of the material index 1: Eurofer, 2: Pb-15.7Li, 3: He, 4: Water, 5: Tungsten Carbide, 6: Boron, 7: Tungsten, 8: Stainless Steel 316) in %vol; Vector
pow_dens_inb	float (7.9.8.1.2)	Peak energy depostion in vaccum vessel inboard [W.m^-3]; Scalar

member	type	description
pow_dens_outb	float (7.9.8.1.2)	Peak energy depostion in vaccum vessel outboard [W.m^-3]; Scalar
fn_flux_inb	float (7.9.8.1.2)	Fast neutron flux in vaccum vessel inboard [m^2.s^-1]; Scalar
fn_flux_outb	float (7.9.8.1.2)	Fast neutron flux in vaccum vessel outboard [m^2.s^-1]; Scalar

Type of: wall_vessel_unit:radial_build (4624)

7.9.8.1.525 waveguides

Waveguides description

member	type	description
nwm_theta	integer (7.9.8.1.3)	Number of waveguides per module in the poloidal direction.
nwm_phi	integer (7.9.8.1.3)	Number of waveguides per module in the toroidal direction.
mask	vecint_type (7.9.8.1.19)	Mask of passive and active waveguides for an internal module; Vector of integers (nwm_phi)
npwbm_phi	integer (7.9.8.1.3)	Number of passive waveguide between modules in the toroidal direction
npwe_phi	integer (7.9.8.1.3)	Number of passive waveguides on each antenna edge in the toroidal direction
sw_theta	float (7.9.8.1.2)	Spacing between poloidally neighboring waveguides [m]
hw_theta	float (7.9.8.1.2)	Height of waveguides in the poloidal direction [m]
bwa	float (7.9.8.1.2)	Width of active waveguides [m]; Float
biwp	float (7.9.8.1.2)	Width of internal passive waveguides [m]; Float
bewp	float (7.9.8.1.2)	Width of edge passive waveguides [m]; Float
e_phi	vecflt_type (7.9.8.1.18)	Thickness between waveguides in the toroidal direction [m], Vector (nthick_phi). Reminder : nthick_phi = nmp_phi*nwm_phi + (nmp_phi - 1)*npwbm_phi + 2*npwe_phi
scl	vecflt_type (7.9.8.1.18)	Short circuit length for passive waveguides [m], Vector (nshort_phi). Reminder : nshort _phi = nmp_phi* npwm_phi + (nmp_phi - 1)*npwbm_phi + 2*npwe_phi

Type of: modules:waveguides (4406)

7.9.8.1.526 waves_global_param

Global wave deposition parameters

member	type	description
name	string (7.9.8.1.4)	Antenna name, String
type	string (7.9.8.1.4)	Wave type (LH, EC, IC, ...), String
f_assumption	vecint_type (7.9.8.1.19)	Assumption on the functions distribution used by the wave solver to calculate the power deposition : 0 = Maxwellian (linear absorption); 1 = quasi-linear (F given by a distribution function CPO). Integer vector (nion+1). The first value corresponds to the electrons, then to the other ion species. Time-dependent.
code_type	integer (7.9.8.1.3)	Type of wave deposition code for a given frequency: 1=beam/ray tracing; 2=full wave; Integer
frequency	float (7.9.8.1.2)	Wave frequency [Hz]; Time-dependent, floating
ntor	vecint_type (7.9.8.1.19)	Toroidal mode numbers; Time-dependent; Vector (ntor)
power_tot	float (7.9.8.1.2)	Total absorbed wave power [W]; Time-dependent
p_frac_ntor	vecflt_type (7.9.8.1.18)	Fraction of wave power per toroidal mode number; Time-dependent; Vector (ntor)
pow_e	float (7.9.8.1.2)	Wave power absorbed by the thermal electrons [W]; Time-dependent; Float
pow_i	vecflt_type (7.9.8.1.18)	Wave power absorbed by the thermal ion species [W]; Time-dependent; Vector (nion)
pow_z	matflt_type (7.9.8.1.15)	Wave power absorbed by the thermal impurity species [W]; Time-dependent; Vector (nimpur, nzimp)
pow_fe	float (7.9.8.1.2)	Wave power absorbed by the fast electrons [W]; Time-dependent; Float
pow_fi	vecflt_type (7.9.8.1.18)	Wave power absorbed by the fast ion species [W]; Time-dependent; Vector (nion)
pow_fz	matflt_type (7.9.8.1.15)	Wave power absorbed by the fast impurity species [W]; Time-dependent; Vector (nimpur, nzimp)
pow_ntor_e	vecflt_type (7.9.8.1.18)	Wave power absorbed by the thermal electrons for each toroidal mode [W]; Time-dependent; Vector (ntor)
pow_ntor_i	matflt_type (7.9.8.1.15)	Wave power absorbed by an the thermal ion species for each toroidal mode [W]; Time-dependent; Matrix (ntor, nion)
pow_ntor_z	array3dflt_type (7.9.8.1.7)	Wave power absorbed by an the thermal impurity species for each toroidal mode [W]; Time-dependent; Matrix (ntor, nimpur, nzimp)
pow_ntor_fe	vecflt_type (7.9.8.1.18)	Wave power absorbed by the fast electrons for each toroidal mode [W]; Time-dependent; Vector (ntor)
pow_ntor_fi	matflt_type (7.9.8.1.15)	Wave power absorbed by an the fast ion species for each toroidal mode [W]; Time-dependent; Matrix (ntor, nion)

member	type	description
pow_ntor_fz	array3dflt_type (7.9.8.1.7)	Wave power absorbed by an the fast impurity species for each toroidal mode [W]; Time-dependent; Matrix (ntor, nimpur, nzimp)
cur_tor	float (7.9.8.1.2)	Wave driven toroidal current from a stand alone calculation (not consistent with other sources) [A]; Time-dependent, Float
cur_tor_ntor	vecflt_type (7.9.8.1.18)	Wave driven toroidal current for each toroidal mode number from a stand alone calculation (not consistent with other sources) [A]; Time-dependent; Vector (ntor)
mag_axis	rz0D (7.9.8.1.386)	Position of the magnetic axis. Time-dependent; Scalar
toroid_field	b0r0 (7.9.8.1.82)	Characteristics of the vacuum toroidal field (used to define the rho_tor coordinate and the normalisation of parallel current densities).

Type of: coherentwave:global_param (4210)

7.9.8.1.527 waves_grid_1d

Grid points for profiles

member	type	description
rho_tor	vecflt_type (7.9.8.1.18)	Toroidal flux coordinate [m]. Defined as sqrt((phi-phi_axis)/pi/B0), where B0=../global_param/toroid_field/b0, phi is the toroidal flux and phi_axis is the toroidal flux at the magnetic axis. Time-dependent; Vector (npsi)
rho_tor_norm	vecflt_type (7.9.8.1.18)	The toroidal flux coordinate normalised to be zero at the axis and unity at the last closed flux surface, or last available fluxsurface if the last closed flux surface is not defined. Time-dependent; Vector (npsi)
psi	vecflt_type (7.9.8.1.18)	Poloidal flux function [Wb], evaluated without 1/2pi, such that Bp=|grad psi| /R/2/pi. Time-dependent; Vector (npsi)
volume	vecflt_type (7.9.8.1.18)	Volume enclosed by the flux surface [m^3]. Time-dependent; Vector (npsi)
area	vecflt_type (7.9.8.1.18)	Cross-sectional area of the flux surface [m^2]. Time-dependent; Vector (npsi)

Type of: coherentwave:grid_1d (4210)

7.9.8.1.528 waves_grid_2d

Grid points for 2D profiles

member	type	description
grid_type	integer (7.9.8.1.3)	Grid type. 1: rectangular grid in (R,Z). 2: rectangular grid in (psi, theta). 3: unstructured grid. Integer.
rho_tor_norm	matflt_type (7.9.8.1.15)	The toroidal flux coordinate normalised to be zero at the axis and unity at the last closed flux surface (or last available fluxsurface from a fix boundary equilibrium code). Time-dependent; Matrix (ndim1, ndim2)
rho_tor	matflt_type (7.9.8.1.15)	Toroidal flux coordinate [m]. Defined as sqrt((phi-phi_axis)/pi/B0), where B0=../global_param/toroid_field/b0, phi is the toroidal flux and phi_axis is the toroidal flux at the magnetic axis. Time-dependent; Matrix (ndim1, ndim2)
psi	matflt_type (7.9.8.1.15)	Grid points in poloidal flux function [Wb], without 1/2pi and such that Bp=|grad psi| /R/2/pi. Time-dependent; Matrix (ndim1, ndim2)
theta	matflt_type (7.9.8.1.15)	Poloidal angle at the grid points (see theta_info for detailed definition); Time-dependent; Matrix (ndim1, ndim2)
r	matflt_type (7.9.8.1.15)	R (major radius) of grid points; Time-dependent; Matrix(ndim1, ndim2)
z	matflt_type (7.9.8.1.15)	Z (altitude) of grid points; Time-dependent; Matrix (ndim1, ndim2)
theta_info	theta_info (7.9.8.1.485)	Information on the poloidal angle theta.

Type of: coherentwave:grid_2d (4210)

7.9.8.1.529 waves_profiles_1d

waves 1D radial profiles

member	type	description
powd_tot	vecflt_type (7.9.8.1.18)	Total flux surface averaged wave power density [W/m^3]; Time-dependent; Vector (npsi)
powd_e	vecflt_type (7.9.8.1.18)	Flux surface averaged absorbed wave power density on the thermal electrons [W/m^3]; Time-dependent; Vector (npsi)
powd_i	matflt_type (7.9.8.1.15)	Flux surface averaged absorbed wave power density on the thermal ion species [W/m^3]; Time-dependent; Matrix (npsi, nion)
powd_z	array3dflt_type (7.9.8.1.7)	Flux surface averaged absorbed wave power density on the thermal impurities species [W/m^3]; Time-dependent; Matrix (npsi, nimpur, nzimp)

member	type	description
powd_fe	vecflt_type (7.9.8.1.18)	Flux surface averaged absorbed wave power density on the fast electrons [W/m^3]; Time-dependent; Vector (npsi)
powd_fi	matflt_type (7.9.8.1.15)	Flux surface averaged absorbed wave power density on the fast ion species [W/m^3]; Time-dependent; Matrix (npsi, nion)
powd_fz	array3dflt_type (7.9.8.1.7)	Flux surface averaged absorbed wave power density on the fast impurities species [W/m^3]; Time-dependent; Matrix (npsi, nimpur, nzimp)
powd_ntor	matflt_type (7.9.8.1.15)	Flux surface averaged power density for each toroidal mode number [W/m^3]; Time-dependent; Matrix(npsi, ntor)
powd_ntor_e	matflt_type (7.9.8.1.15)	Flux surface averaged power density absorbed for each toroidal mode number on the thermal electrons [W/m^3]; Time-dependent; Matrix (npsi, ntor)
powd_ntor_i	array3dflt_type (7.9.8.1.7)	Flux surface averaged power density absorbed for each toroidal mode number on each thermal ions species [W/m^3]; Time-dependent; Array3D (npsi, ntor, nion)
powd_ntor_z	array4dflt_type (7.9.8.1.9)	Flux surface averaged power density absorbed for each toroidal mode number on each thermal impurity species [W/m^3]; Time-dependent; Array3D (npsi, ntor, nimpur, nzimp)
powd_ntor_fe	matflt_type (7.9.8.1.15)	Flux surface averaged power density absorbed for each toroidal mode number on the fast electrons [W/m^3]; Time-dependent; Matrix (npsi, ntor)
powd_ntor_fi	array3dflt_type (7.9.8.1.7)	Flux surface averaged power density absorbed for each toroidal mode number on each fast ions species [W/m^3]; Time-dependent; Array3D (npsi, ntor, nion)
powd_ntor_fz	array4dflt_type (7.9.8.1.9)	Flux surface averaged power density absorbed for each toroidal mode number on each fast impurity species [W/m^3]; Time-dependent; Array3D (npsi, ntor, nimpur, nzimp)
curd_tor	vecflt_type (7.9.8.1.18)	Flux surface averaged wave driven toroidal current density = average(jphi/R) / average(1/R) [A/m^2]; Time-dependent; Vector (npsi)
curd_torntor	matflt_type (7.9.8.1.15)	Flux surface averaged wave driven toroidal current density for each toroidal mode number = average(jphi/R) / average(1/R) [A/m^2]; Time-dependent; Matrix (npsi, ntor)
pow_tot	vecflt_type (7.9.8.1.18)	Cumulative volume integral of the absorbed wave power density [W]; Time-dependent; Vector (npsi)
pow_e	vecflt_type (7.9.8.1.18)	Cumulative volume integral of the absorbed wave power on the thermal electrons [W]; Time-dependent; Vector (npsi)
pow_i	matflt_type (7.9.8.1.15)	Cumulative volume integral of the absorbed wave power on the thermal ion species [W]; Time-dependent; Matrix (npsi, nion)
pow_z	array3dflt_type (7.9.8.1.7)	Cumulative volume integral of the absorbed wave power on the thermal impurities species [W]; Time-dependent; Matrix (npsi, nimpur, nzimp)
pow_fe	vecflt_type (7.9.8.1.18)	Cumulative volume integral of the absorbed wave power on the fast electrons [W]; Time-dependent; Vector (npsi)
pow_fi	matflt_type (7.9.8.1.15)	Cumulative volume integral of the absorbed wave power on the fast ion species [W]; Time-dependent; Matrix (npsi, nion)
pow_fz	array3dflt_type (7.9.8.1.7)	Cumulative volume integral of the absorbed wave power on the fast impurities species [W]; Time-dependent; Matrix (npsi, nimpur, nzimp)
pow_ntor	matflt_type (7.9.8.1.15)	Cumulative volume integral of the absorbed wave power for each toroidal mode number [W]; Time-dependent; Matrix (npsi, ntor)
pow_ntor_e	matflt_type (7.9.8.1.15)	Cumulative volume integral of the absorbed wave power for each toroidal mode number on the thermal electrons [W]; Time-dependent; Matrix (npsi, ntor)
pow_ntor_i	array3dflt_type (7.9.8.1.7)	Cumulative volume integral of the absorbed wave power for each toroidal mode number on each thermal ions species [W]; Time-dependent; Array3D (npsi, ntor, nion)
pow_ntor_z	array3dflt_type (7.9.8.1.7)	Cumulative volume integral of the absorbed wave power for each toroidal mode number on each thermal impurity species [W]; Time-dependent; Array3D (npsi, ntor, nimpur, nzimp)
pow_ntor_fe	matflt_type (7.9.8.1.15)	Cumulative volume integral of the absorbed wave power for each toroidal mode number on the fast electrons [W]; Time-dependent; Matrix (npsi, ntor)
pow_ntor_fi	array3dflt_type (7.9.8.1.7)	Cumulative volume integral of the absorbed wave power for each toroidal mode number on each fast ions species [W]; Time-dependent; Array3D (npsi, ntor, nion)
pow_ntor_fz	array3dflt_type (7.9.8.1.7)	Cumulative volume integral of the absorbed wave power for each toroidal mode number on each fast impurity species [W]; Time-dependent; Array3D (npsi, ntor, nimpur, nzimp)
curd_par	vecflt_type (7.9.8.1.18)	Flux surface averaged wave driven parallel current density = average(j.B) / B0, where B0 = global_param/toroid_field/b0; [A/m^2]; Time-dependent; Vector (npsi)
curd_parntor	matflt_type (7.9.8.1.15)	Flux surface averaged wave driven parallel current density for each toroidal mode number = average(j.B) / B0, where B0 = global_param/toroid_field/b0; [A/m^2]; Time-dependent; Matrix (npsi, ntor)
cur_tor	vecflt_type (7.9.8.1.18)	Wave driven toroidal current inside a flux surface [A]; Time-dependent; Vector (npsi)
cur_tor_ntor	matflt_type (7.9.8.1.15)	Wave driven toroidal current inside a flux surface for each toroidal mode number [A]; Time-dependent; Matrix (npsi, ntor)
e_plus_ave	matflt_type (7.9.8.1.15)	The left hand polarised electric field component, E_plus [V/m], averaged over the flux surface, where the averaged is weighted with the power depotition, P, such that e_plus_ave = ave(E_plus P) / ave(P), where ave(*) is the flux surface average operator; Time-dependent; Matrix (npsi, ntor)
e_minus_ave	matflt_type (7.9.8.1.15)	The right hand polarised electric field component, E_minus [V/m], averaged over the flux surface, where the averaged is weighted with the power depotition, P, such that e_minus_ave = ave(E_minus P) / ave(P), where (*) is the flux surface average operator; Time-dependent; Matrix (npsi, ntor)
e_para_ave	matflt_type (7.9.8.1.15)	The parallel electric field component, E_para [V/m], averaged over the flux surface, where the averaged is weighted with the power depotition, P, such that e_para_ave = ave(E_para P) / ave(P), where ave(*) is the flux surface average operator; Time-dependent; Matrix (npsi, ntor)

member	type	description
k_perp_ave	matflt_type (7.9.8.1.15)	The perpendicular wave number, k_perp [1/m], averaged over the flux surface, where the averaged is weighted with the power depotition, P, such that k_perp_ave = ave(k_perp P) / (P), where ave(*) is the flux surface average operator; Time-dependent; Matrix (npsi, ntor)

Type of: coherentwave:profiles_1d (4210)

7.9.8.1.530 waves_profiles_2d

waves 2D profiles in poloidal cross-section

member	type	description
powd_tot	matflt_type (7.9.8.1.15)	Total wave power density; Time-dependent [W/m^3]; Matrix (ndim1, ndim2)
powd_e	matflt_type (7.9.8.1.15)	Absorbed wave power density on the thermal electrons [W/m^3]; Time-dependent; Matrix (ndim1, ndim2)
powd_i	array3dflt_type (7.9.8.1.7)	Absorbed wave power density on each thermal ion species [W/m^3]; Time-dependent; Array3D (ndim1, ndim2, nion)
powd_z	array4dflt_type (7.9.8.1.9)	Absorbed wave power density on each thermal impurity species [W/m^3]; Time-dependent; Array3D (ndim1, ndim2, nimpur, nzimp)
powd_fe	matflt_type (7.9.8.1.15)	Absorbed wave power density on the fast electrons [W/m^3]; Time-dependent; Matrix (ndim1, ndim2)
powd_fi	array3dflt_type (7.9.8.1.7)	Absorbed wave power density on each fast ion species [W/m^3]; Time-dependent; Array3D (ndim1, ndim2, nion)
powd_fz	array4dflt_type (7.9.8.1.9)	Absorbed wave power density on each fast impurity species [W/m^3]; Time-dependent; Array3D (ndim1, ndim2, nimpur, nzimp)
powd_ntor	array3dflt_type (7.9.8.1.7)	Absorbed power density for each toroidal mode number [W/m^3]; Time-dependent; Array 3D (ndim1, ndim2, ntor)
powd_ntor_e	array3dflt_type (7.9.8.1.7)	Absorbed power density for each toroidal mode number on the thermal electrons [W/m^3]; Time-dependent; Array 3D (ndim1, ndim2, ntor)
powd_ntor_i	array4dflt_type (7.9.8.1.9)	Absorbed power density for each toroidal mode number on each thermal ions species [W/m^3]; Time-dependent; Array4D (ndim1, ndim2, ntor, nion)
powd_ntor_z	array5dflt_type (7.9.8.1.10)	Absorbed power density for each toroidal mode number on each thermal impurity species [W/m^3]; Time-dependent; Array4D (ndim1, ndim2, ntor, nimpur, nzimp)
powd_ntor_fe	array3dflt_type (7.9.8.1.7)	Absorbed power density for each toroidal mode number on the fast electrons [W/m^3]; Time-dependent; Array 3D (ndim1, ndim2, ntor)
powd_ntor_fi	array4dflt_type (7.9.8.1.9)	Absorbed power density for each toroidal mode number on each fast ions species [W/m^3]; Time-dependent; Array4D (ndim1, ndim2, ntor, nion)
powd_ntor_fz	array5dflt_type (7.9.8.1.10)	Absorbed power density for each toroidal mode number on each fast impurity species [W/m^3]; Time-dependent; Array4D (ndim1, ndim2, ntor, nimpur, nzimp)
powd_iharm	array5dflt_type (7.9.8.1.10)	Power density absorbed by an ion species for each toroidal mode numer at a given harmonic cyclotron resonance ; Time-dependent (W/m^3); Array5D (ndim1, ndim2, ntor, nion, nharm)

Type of: coherentwave:profiles_2d (4210)

7.9.8.1.531 waves_rtposition

Ray/beam position

member	type	description
r	vecflt_type (7.9.8.1.18)	Major radius location [m]; Time-dependent; Vector (npoints)
z	vecflt_type (7.9.8.1.18)	Vertical location [m]; Time-dependent; Vector (npoints)
phi	vecflt_type (7.9.8.1.18)	Toroidal angle location [rad]; Time-dependent; Vector (npoints)
psi	vecflt_type (7.9.8.1.18)	Poloidal magnetic flux coordinate [Wb], without 1/2pi and such that Bp=|grad psi| /R/2/pi; Time-dependent; Vector (npoints)
theta	vecflt_type (7.9.8.1.18)	Poloidal angle location [rad]; Time-dependent; Vector (npoints). PRECISE THE DEFINITION OF THE POLOIDAL ANGLE, SEE WAVES/COHERENTWAVE(:)/GRID_2D.

Type of: beamtracing:position (4192)

7.9.8.1.532 waves_rtwavevector

Ray/beam wave vector

member	type	description
kr	vecflt_type (7.9.8.1.18)	Wave vector in the major radius direction [m**-1], Vector (npoints). Time-dependent
kz	vecflt_type (7.9.8.1.18)	Wave vector in the vertical direction [m**-1], Vector (npoints). Time-dependent
kphi	vecflt_type (7.9.8.1.18)	Wave vector in the toroidal direction [m**-1], Vector (npoints). Time-dependent

member	type	description
npar	vecflt_type (7.9.8.1.18)	Parallel refractive index, Vector (npoints). Time-dependent
nperp	vecflt_type (7.9.8.1.18)	Perpendicular refractive index, Vector (npoints). Time-dependent
ntor	vecflt_type (7.9.8.1.18)	Toroidal wave number, Vector (npoints/1). If var_ntor=0, ntor is constant along the ray path and the last dimension is of size 1 in order to avoid useless repetition of ntor constant value. Time-dependent
var_ntor	integer (7.9.8.1.3)	Flag telling whether ntor is constant along the ray path (0) or varying (1). Integer

Type of: beamtracing:wavevector (4192)

7.9.8.1.533 weighted_markers

Array of NMARK weighted markers in NDIM dimensions

member	type	description
variable_ids(:)	identifier (7.9.8.1.263)	Identifier for the variable_ids stored in the coord matrix (see coordinate_identifier_definitions in the Documentation website under Conventions/Enumerated_datatypes). Vector(NDIM)
coord	matflt_type (7.9.8.1.15)	Coordinates of the markers. The coordinates used is specified in variable_ids. Time-dependent; Float(NMARK,NDIM)
weight	vecflt_type (7.9.8.1.18)	Weight of the marker; number of real particles represented by the marker. Time-dependent; Float(NMARK)

Type of: dist_func:markers (4277) I distsource_source:markers (4302)

7.9.8.1.534 whatref

Structure defining a database entry and the CPO occurrence

member	type	description
user	string (7.9.8.1.4)	Name of the user if private data, public if public ITM database.
machine	string (7.9.8.1.4)	Name of the device
shot	integer (7.9.8.1.3)	Shot number
run	integer (7.9.8.1.3)	Run number
occurrence	integer (7.9.8.1.3)	Occurrence number of the CPO in the reference entry

Type of: datainfo:whatref (4265)

7.9.8.1.535 width

Angular width of each in the poloidal and toroidal direction;

member	type	description
dtheta	vecflt_type (7.9.8.1.18)	Angular poloidal width of holes; Vector (n_holes)
phi	vecflt_type (7.9.8.1.18)	Angular toroidal width of holes; Vector (n_holes)

Type of: holes:width (4365)

7.9.8.1.536 xpts

Position of the X-point(s)

member	type	description
position	rz1D (7.9.8.1.387)	Position of the X-point(s); Time-dependent; Vector (nmeas)
source	string (7.9.8.1.4)	Description or path to the source signal (diagnostic or genprof, from which to read all info on the signal), e.g. 'magdiag/bpol_probes/measure/value'. String
weight	vecflt_type (7.9.8.1.18)	weight given to the measurement (¿= 0); -1 if exact data; Time-dependent; Vector (nmeas)
sigma	vecflt_type (7.9.8.1.18)	standard deviation of the measurement; Time-dependent; Vector (nmeas)
calculated	vecflt_type (7.9.8.1.18)	Signal as recalculated by the equilibrium code; Time-dependent; Vector (nmeas)
chi2	vecflt_type (7.9.8.1.18)	chi^2 of (calculated-measured); Time-dependent; Vector (nmeas)

Type of: eqconstraint:xpts (4320)

7.9.8.1.537 xyz0D

Structure for a single (x,y,z) position (0D)

member	type	description
x	float (7.9.8.1.2)	Spatial coordinate x [m]
y	float (7.9.8.1.2)	Spatial coordinate y [m]
z	float (7.9.8.1.2)	Spatial coordinate z [m]

Type of: flat_polygon:basis1 (4333) I flat_polygon:basis2 (4333) I flat_polygon:origin (4333) I rectanglexyz:point01 (4477) I rectanglexyz:point10 (4477) I rectanglexyz:point11 (4477) I trianglexyz:point1 (4597) I trianglexyz:point2 (4597) I trianglexyz:point3 (4597) itmtypes [569]

8 IMP4

8.1 IMP4

The IMP4 web site is here. [571]

8.2 Scientific Rationale and Main Objectives

Provide turbulence, neoclassical, and linear instability codes as well as simple transport modules to the rest of the ITM. Also, some standards keeping. For more detail see above.

8.3 Documentation

Some of this exists here but most is on the main page. However, all relevant links are here:

- running the IMP4 benchmark [572]
- IMP4 codes in ITM workflows [573]
- an example of how to get CPO information including parameters into your code is the ETAIGB project [574] on Gforge [575]
- **for ETS/IMP3 users:** test workflows for IMP4 actors [576]
- serving transport quantities to the rest of ITM (8.5)
- the running exponential average (8.6)
- how to load the `coretransp` CPO (8.7)
- Neoclassical code comparisons
  - bootstrap current (8.8)
  - Ds and Chis (8.9)
- auxiliary IMP4 actors (like Ds and Vs, flux handling, etc) (8.10)

8.4 Private IMP4 pages

None exist (they may do in the future... for now I want IMP4 stuff open to the rest of the ITM).

(For access to the private IMP4 pages [577], an IMP4 password would have been needed)

8.5 Turbulent Flux Quantities in Transport Models

8.5.1 Overview

In conventional transport modelling, all quantities appearing in the equations are 1-D, in some radial coordinate (poloidal flux, normalised radius, etc). In general any monotonic radial coordinate is acceptable. In the TF-ITM, the toroidal flux radius is standard. All we need from the radial coordinate is the transformation to get to V, the volume enclosed by the flux surface, which is fundamental to the governing equations, which are conservation laws.

What we have to do is to take a measured result, which is a time-averaged fluctuation-based transport flux and turn it into 1-D quantities suitable to modelling. This is done using the flux surface average, explained in **conventions.** The transport equations themselves constitute a mean field approximation to the 3-D conservation laws. For the fundamentals encountered in transport modelling see R Hazeltine and J Meiss, *Plasma Confinement* (Addison-Wesley, 1992) chapter 8. For the special properties of transport driven by small-scale

pressure driven ExB microturbulence see B Scott, "The character of transport caused by ExB drift turbulence," *Phys Plasmas* **10** (2003) 963-976.

For ambipolarity we follow the rules for dynamical alignment, which follows the physics of how electron fluctuations determine the ExB velocity fluctuations, which then advect all species. Magnetic flutter nonlinearities act independently of this, but in our modelling they are used solely for heat fluxes since the averaged particle transport due to magnetic flutter and the current cancels, leaving the parallel ion velocity which we neglect for this purpose. The reference for dynamical alignment is B Scott, "Dynamical alignment in three species tokamak edge turbulence," *Phys Plasmas* **12** (2005) 082305.

Note: there are now auxiliary actors provided for this purpose: IMP4DV, which does the D/V conversion and enforces ambipolarity assuming absence of impurities, and IMP4imp, which subsequently enforces ambipolarity for the set of main ion and impurity species. The IMP4DV actor should be invoked directly after the transport model actor in the workflow chain, if the model produces only fluxes or if the coefficients have to be modified with the flux given. Ambipolarity is done using IMP4imp if the `coreimpurity` CPO is used in the workflow. These auxiliary actors are described on the auxiliary actors page. (8.10)

8.5.2 Particle Flux as an Example

The mean field equation governing particle balance is the transport equation for electrons,

$$\frac{\partial}{\partial t}\langle n\rangle + \langle\vec{\nabla}\cdot\widetilde{n}\vec{\widetilde{v}}_E\rangle = S$$

in which the tilde symbol over the n and v denotes fluctuating quantities and we neglect all transport processes except ExB eddy diffusion. The ExB velocity is given by

$$\vec{v}_E = \frac{c}{B^2}\vec{B}\times\vec{\nabla}\phi$$

where ϕ is the electrostatic potential.

The angle brackets denote the flux surface average, and we will use the property that the flux surface average of a divergence of a vector is the volume derivative of the flux surface average of a contravariant volume component of the vector, in this case

$$\langle\vec{\nabla}\cdot\vec{\Gamma}\rangle = \frac{\partial}{\partial V}\langle\Gamma^V\rangle$$

where Γ is the particle flux whose flux-surface averaged volume component is

$$\langle\Gamma^V\rangle = \langle\widetilde{n}\widetilde{v}_E^V\rangle$$

This is converted to expression in terms of the radial coordinate ρ using the fact that both V and ρ are flux quantities whose gradients are parallel to each other. We have

$$\frac{\partial}{\partial V} = \frac{1}{V'_\rho}\frac{\partial}{\partial\rho} \qquad \Gamma^\rho = \frac{1}{V'_\rho}\Gamma^V \qquad V'_\rho = \frac{\partial V}{\partial\rho} \qquad g^{VV} = (V'_\rho)^2 g^{\rho\rho}$$

so we can write the transport equation as

$$\frac{\partial n}{\partial t} + \frac{1}{V'_\rho}\frac{\partial}{\partial\rho}V'_\rho\langle\Gamma^\rho\rangle = S,$$

where we have replaced $\langle n\rangle$ with n following the assumptions of the 1-D version of mean field transport theory.

With all quantities now expressed in terms of flux quantities, we are free to characterise the transport flux $\langle\Gamma^\rho\rangle$ in an arbitrary way, so long as only flux quantities appear. The flux expansion within the flux surface as well as expansion or contraction of surfaces of constant ρ

is treated using the metric coefficient $g^{\rho\rho}$ which is dimensionless. This way we can characterise transport in terms of an effective diffusivity and an effective frictional slip velocity which are given in SI units. By convention both of these are done solely via $g^{\rho\rho}$ for convenience, also reflecting that the effective velocity is actually marking off-diagonal diffusive elements. Our convention for this follows the ETS code and is given by

$$\langle \Gamma^\rho \rangle = \langle g^{\rho\rho} \rangle \left(nV_{\text{eff}} - D_{\text{eff}} \frac{\partial n}{\partial \rho} \right)$$

So despite the special spatial distribution of any particular transport process (ie, the underlying instability or nonlinear free energy access), the flux-surface averaged flux itself and its expression in terms of diffusion and frictional slip are identical characterisations.

8.5.3 Metric Coefficients

Transport modellers want the Ds and Vs as physical quantities in SI units. In general the fluxes are (magnetic) flux surface averaged quantities, which implies the existence of metric elements in the conversion. In our case we need $\langle g^{\rho\rho} \rangle$ where ρ is the toroidal flux radius in meters, so the metric elements are dimensionless. In the `equilibrium CPO` , this is `gm3` under `equilibrium%profiles_1d` in the structure.

Note this is different from the ASTRA code which casts the Vs as proper velocities, i.e., with one factor of grad-rho given by $\langle \sqrt{g^{\rho\rho}} \rangle$ which is `gm7` under `equilibrium%profiles_1d` in the structure. The units are the same and the informational content is the same, but this difference has to be taken into account in any transport modelling and benchmarking.

8.5.4 Heat Fluxes

The heat flux is treated in a similar way, with transport equation

$$\frac{3}{2} \frac{\partial p_e}{\partial t} + \frac{1}{V'_\rho} \frac{\partial}{\partial \rho} V'_\rho \langle q_e^\rho \rangle = Q_e + \sum_{\text{ions}} T_{ei},$$

for electrons, with T_{ei} giving the species transfer and Q_e the source. For ExB transport the heat flux has a advective (also called convective) and a conductive piece given by

$$q_E = q_{E\text{cond}} + (3/2)T\Gamma_E$$

which appears with a 3/2 due to the Poynting cancellation. For magnetic flutter transport the advective piece appears with the usual factor,

$$q_m = q_{m\text{cond}} + (5/2)T\Gamma_m$$

Here the forms are given for each species and E and m refer to the ExB eddy and magnetic flutter channels, respectively. For reasons given below we are neglecting the magnetic flutter piece Γ_m for the time being, and then the flutter piece merely adds to the heat diffusivity.

The forms of these due to the fluctuations are then

$$\langle q^\rho \rangle = (3/2)\langle \widetilde{p}\widetilde{v}_E^\rho \rangle + \langle \widetilde{q}_\| \widetilde{b}^\rho \rangle$$

which breaks into advective and conductive pieces according to linearisation of the pressure fluctuations

$$\langle q_{\text{cond}}^\rho \rangle = (3/2)n\langle \widetilde{T}\widetilde{v}_E^\rho \rangle + \langle \widetilde{q}_\| \widetilde{b}^\rho \rangle \qquad \langle q_{\text{adv}}^\rho \rangle = (3/2)T\Gamma = (3/2)T\langle \widetilde{n}\widetilde{v}_E^\rho \rangle$$

hence the density fluctuation piece is accounted for by the particle flux. Neglect of the magnetic flutter advective piece (and particle flux) is the same as neglect of the $\widetilde{u}_\parallel \widetilde{b}^\rho$ nonlinearity (in the delivery of the results, not in the turbulence computations themselves).

The total conductive flux is then represented by

$$\langle q^\rho_{\rm cond} \rangle = \langle g^{\rho\rho} \rangle \left(nTY_{\rm eff} - n\chi_{\rm eff}\frac{\partial T}{\partial \rho} \right)$$

with χ and Y giving the heat diffusion and frictional slip pieces for each species, respectively (these are in diff_eff and vconv_eff in the CPO for each quantity).

Operationally, the turbulence module communicates the diff_eff and vconv_eff due to each transport channel for each species to the transport solver, and the metric coefficients are used by both modules. The two modules can be on arbitrarily different grids, which communicate through standard interpolation. This despite the fact that transport at the micro-level is angle dependent (in general, it can be 3-D in the time average if the sources are 3-D). The effective transport is 1-D so long as parallel sound transit within the flux surface remains fast compared to the local transport time. This breaks down anyway in the edge, so the fact that the volume is a problematic coordinate and the flux surface average is a problematic operation on open field lines doesn't enter.

8.5.5 Ds and Vs from Turbulence Codes to Transport Solvers

To serve the results from turbulence codes to transport solvers, we have to turn the fluxes (results) into diffusivities and effective velocities (coefficients, Ds and Vs for short), which represent more information than is at hand. Transport solvers must work with Ds and Vs because they use implicit schemes. The matrix must be diagonally dominant; hence one cannot simply use the Vs. Fluxes which are zero and/or negative should be given with positive diffusivities for the solvers to work. We need a set of rules to provide this.

Considering the particle and heat transport fluxes for a given species, we convert the gradient in to a logarithmic derivative and express the flux in terms of a specific flux, which has units of velocity,

$$F = \frac{1}{n}\langle g^{\rho\rho}\rangle^{-1}\langle \Gamma^\rho \rangle = V_{\rm eff} - D_{\rm eff}\frac{\partial \log n}{\partial \rho}$$
$$G = \frac{1}{nT}\langle g^{\rho\rho}\rangle^{-1}\langle q^\rho_{\rm cond} \rangle = Y_{\rm eff} - \chi_{\rm eff}\frac{\partial \log T}{\partial \rho}$$

wherein the conductive part of the heat flux (without the $3\Gamma/2$) enters.

The choice of what to do with the Ds and Vs is somewhat arbitrary. The needs of implicit transport solvers is for a positive D regardless of the value or sign of either flux. We decide this by putting a limit on the effective Prandtl number or its inverse: the larger specific flux is taken to be entirely diffusive, with the effective velocity set to zero. Furthermore, to address cases with very small or negative gradients, we use proxy variables for the scale lengths to calculate the provisional diffusivities before using the Prandtl number limitation to turn these into actual diffusivities. Finally, the rest of the flux is asigned to the effective velocity, so that the D and V formula reflects the actual specific flux.

The Prandtl number limitation is expressed as follows. If the smaller specific flux is within a factor of 5 of the larger, then both are purely diffusive and the effective velocities are both zero. If not, then the D ratio is set to 5, with the result that the smaller D, having been corrected, is accompanied by the corresponding V, which is now nonzero. The specific flux with the larger D will be returned with a V which is zero.

The rationale is that the turbulent mixing by the ExB velocity affects all processes, but that linear forcing can shift the average phase shift of the fluctuations such that the effective flux can be small or negative. The simplest example is adiabatic electrons, for which the ion heat flux is robust but the particle flux is zero. In most situations the specific heat flux will be the larger, and hence the familiar situation is that of a D and V for the particle flux but a D (the chi) only for the conductive heat flux.

The full algorithm starting with the specific fluxes appears as

$$L_n^{-1} = \max\left(\frac{1}{R}\,,\,\left|\frac{\partial \log n}{\partial \rho}\right|\right) \qquad L_T^{-1} = \max\left(\frac{1}{R}\,,\,\left|\frac{\partial \log T}{\partial \rho}\right|\right)$$
$$D' = |F|\,L_n \qquad \chi' = |G|\,L_T$$
$$D = \max\left(D'\,,\,\tfrac{1}{5}\chi'\right) \qquad \chi = \max\left(\chi'\,,\,\tfrac{1}{5}D'\right)$$
$$V = \left(F + D\frac{\partial \log n}{\partial \rho}\right) \qquad Y = \left(G + \chi\frac{\partial \log T}{\partial \rho}\right)$$

and all four elements are set. Note that the channels are done in parallel except for the Prandtl correction, in which the Max's are taken sequentially. For the provisional diffusivities, absolute values are used to ensure positive values which are needed by transport solvers.

Note how in the end the actual gradients are used. If the gradients are moderate then their actual values are used, and if the Prandtl correction is not invoked, then both channels are diagonal. In any case the full relation is used to get the effective velocities (V and Y) so having set the rules to handle the arbitrariness of the diffusivities (D and chi) to guarantee reasonable diagonal dominance in a transport solver, the D's and V's agree with the fluxes themselves.

If there are more than two specific fluxes per species to consider, then we treat each scale length separately as above and use N-way maxima in the Prandtl correction for the N channels.

8.5.6 Ambipolarity

There remains the issue of ambipolarity of the D and V for particle flux. For a pure singly charged plasma the ion and electron Ds and Vs should be equal. Even if the turbulence model is gyrokinetic or gyrofluid, in which case the gyrocenter charge density is not zero but is equal to the generalised vorticity (polarisation), the quantities given to a transport solver should follow the rules for a fluid representation. However, transport modelling usually applies ambipolarity rules to the electrons after computing the ions, while the action of turbulence is actually the other way around: Dynamical alignment refers to the process by which (1) electron parallel dynamics controls the electrostatic fluctuations, then (2) the resulting ExB velocity advects all species equally. So we correct the particle fluxes by assuming the electrons determine the D according to the above procedure and then (1) the fluctuations in the flux-inducing part of the spectrum for the logarithmic densities are the same, and (2) the D's are the same. Then the V's are solved for again, by taking

$$D_z = D_e = D \qquad V_z = V_e + D\frac{\partial \log b_z}{\partial \rho} \qquad b_z = n_z/n_e$$

This is better than the transport modelling convention but will give them the same information in a different way, and they will compute ambipolar particle fluxes (radial transport of charge is zero).

8.5.7 Statistical Character

Turbulence has a statistical character, so convergence to a mean is not monotonic and when within one std dev of the mean there is no further convergence. The diffusivity for ExB turbulence is comparable to

$$D_E = \langle(\widetilde{v}_E)^2\rangle / \langle(\varpi)^2\rangle^{1/2} \qquad \varpi_E = \frac{c}{B}\nabla_\perp^2\widetilde{\phi}$$

where ϖ_E is the ExB vorticity fluctuation, and these angle brackets denote the ensemble average. To get an ensemble average over a statistical quantity in practice, one must do some sort of finite-time running averaging.

For transport modelling, the transport coefficients derived from a turbulence code should always be given in terms of running exponential averages. (8.6)

A HOWTO for loading the `coretransp` CPO is given here. (8.7)

8.6 Running Exponential Average

8.6.1 Overview

In conventional transport modelling, turbulent fluxes are modelled in terms of processes which are diffusive in the local relaxation sense, with the average flux given by a diffusion coefficient and an effective pinch velocity. The equations are of dominantly parabolic character, which means in practice that an iterate will move monotonically towards the solution in parameter space.

This is not the case for turbulence. Convergence is statistical, which is something different than a diffusive relaxation. If turbulence is stationary, it is meant only that the mean of a distribution of iterates is stationary, not the iterates themselves. The standard deviation can be significant, of order unity compared to the mean, of any distribution of iterates.

This makes for a noisy signal if the output of a turbulence code is used for transport coefficients in a workflow. A sound way to overcome the attendant problems is to use a moving average. Even an average over a moving window can be as noisy as the original signal, however. What works better is a weighted average over recent past values. A method to get this is called a **running exponential average,** which is essentially the same thing as a convolution integral over an exponential memory decay times the past signal. It turns out to be very easy to obtain this without saving past values.

The original reference for the following is S W Roberts, "Control Chart Tests Based on Geometric Moving Averages," *Technometrics* **1** (1959) 239-250, cited by all the good WWW resources, including the Wikipedia page on Moving Averages and the NIST Statistical Handbook online.

8.6.2 Definition

Consider a process $p(\vec{u})$ which is a functional of dependent variables $\vec{u}$. Measure p at discrete time intervals t_n, with values $p_n = p(t_n)$

and interval length $\tau = t_n - t_{n-1}$. The moving exponential average $A_n = A(p_n)$ on the n-th interval is defined as

$$A_n = \epsilon p_n + (1-\epsilon)A_{n-1} \qquad \text{with} \qquad \epsilon = \alpha\tau$$

in which the small parameter ϵ is given in terms of the interval τ and an inverse time constant α.

In the first instance p is measured there is no A so the first value of A is simply set to p since it can be assumed that the initial state for p has persisted for infinite previous time up to the initial time point.

8.6.3 Differential Equation

The equivalent differential equation is found by forming the relevant finite difference,

$$A_n - A_{n-1} = \epsilon(p_n - A_{n-1})$$

which we can also cast as

$$(1-\epsilon)(A_n - A_{n-1}) = \epsilon(p_n - A_n)$$

Taking the limit $\tau \to 0$ is the same as taking $\epsilon \to 0$ so both of these expressions become equivalent to

$$\frac{\partial A}{\partial t} = \alpha(p - A)$$

whose solution is given below.

8.6.4 Equivalence to Past-Time Convolution Integral

The solution of the above differential equation is given by the method of undetermined coefficients,

$$\begin{aligned}
&\frac{\partial A}{\partial t} + \alpha\, A = \alpha\, p \\
&e^{-\alpha t}\frac{\partial}{\partial t}\left(e^{\alpha t} A\right) = \alpha\, p \\
&\frac{\partial}{\partial t}\left(e^{\alpha t} A\right) = \alpha\, p\, e^{\alpha t}
\end{aligned}$$

We may integrate this over all past time, to find

$$A(t) = \int_{-\infty}^{t} \alpha\, dt'\; p(t')\, e^{-\alpha(t-t')}$$

This is a convolution integral over the kernel $e^{-\alpha(t-t')}$ and the signal $p(t')$. The time constant α^{-1} is just the memory decay time, while if p is constant then the integral yields unity times p. This is the same as the normalisation with the $(1-\epsilon)$ factor in the average formula above, which is needed since the interval is of finite size.

Hence the running exponential average is operationally the same as a memory decay integral over past time. The elegant feature is the need to keep only the current value of A, as it already contains all that is needed of the past time evolution of p.

8.6.5 notes

Some properties of the running exponential average and how to choose its main time-memory parameter:

- The $(1-\epsilon)$ factor is needed for normalisation
- if $p =$ constant then $A = p$ for all t
  - the integral with $\alpha\, dt'$ yields unity
  - the ϵ and $(1-\epsilon)$ factors add to unity
  - therefore set the first value of A to the first value of p
- in choosing the memory decay time α^{-1} ...
  - one should have $\alpha\tau_{\rm cor} \ll 1$
  - best results are for $\alpha\tau_{\rm sat} \sim 1$
  - some trial/error required; edge turbulence likes $\alpha^{-1} = 200L_\perp/c_s$

In these expressions $\tau_{\rm cor}$ and $\tau_{\rm sat}$ are the correlation and saturation times of the turbulence, respectively.

8.7 How to Load the Coretransp CPO

8.7.1 Where to Put the Ds and Vs additional to the Fluxes

The CPO form for each transport channel contains `diff_eff`, `vconv_eff`, and `flux` as the three pieces of relevance to us.

As the simplest example we take the electron temperature channel (conductive heat flux). The entire section is `coretransp%te_transp` which is of type `transcoefel`. The contents are then given by the relevant section of `euitm_schemas` which is

```
type type_transcoefel
  real(DP),pointer  :: diff_eff(:) => null()
  real(DP),pointer  :: vconv_eff(:) => null()
  real(DP),pointer  :: flux(:) => null()
  type (type_offdiagel) :: off_diagonal
  integer  :: flag=-999999999
endtype
```

So for these the first three elements are all dimensioned to `nrho` which is the number of radial points on the turbulence code's grid. It has been decided (Cyprus 2011 Code Camp) that the IMP4 codes should not try to interpolate onto another CPO grid, because the transport modelling should be left with the flexibility (ie, take the core portion from a global code and the edge layer from an edge code which might have different physics). The off-diagonal elements are left blank by turbulence codes.

The next is the electron density channel (main particle flux). The entire section is `coretransp%ne_transp` which is of type `ne_transp`. The contents are then given by the relevant section of `euitm_schemas` which is

```
type type_ne_transp
  real(DP),pointer  :: diff_eff(:,:) => null()
  real(DP),pointer  :: vconv_eff(:,:) => null()
  real(DP),pointer  :: flux(:) => null()
  type (type_offdiagel) :: off_diagonal
  integer  :: flag=-999999999
endtype
```

which is just like the `transcoefel` except the first two elements have an extra index (the last one). This is dimensioned `1:3` and tells the transport solver which coefficient appears with convective heat fluxes: the multiplier is 0, 3/2, or 5/2, and the relevant D and V go into position 1, 2, or 3, respectively. It is possible to have two channels with different multipliers. The ExB transport has multiplier 3/2 due to the Poynting cancellation, but the parallel velocity component of magnetic flutter has multiplier 5/2. So the conductive D and V coefficients are added together into the `te_transp` channel, and the particle D and V coefficients from the ExB and flutter pieces are put into positions 2 and 3, respectively. Note that although the part of magnetic flutter transport arising from parallel current and radial magnetic fluctuations vanishes in the average, the ion parallel velocity is left over and can contribute in unusual situations.

The ion species are done just like the electrons, but the types are `transcoefion` and `ni_transp` with an extra second index in all variables, for the ion species index. For a pure plasma (e and i only), the dimension of the second index is `nion = 1` and the density D and V now have a third index which is the one for the 0, 3/2, or 5/2 multipliers. All other considerations are as for the electrons.

Examples for how these should be loaded appear in `bscott/public/HDF5_files/global/` and `bscott/public/HDF5_fil` for global and fluxtube codes, respectively, with the filename being `itmfluxes.f90`

8.8 Neoclassical Bootstrap Current Comparison

8.8.1 The Models

NeoWes is a simple neoclassical module intended for circular models, using a set of formulae from Wesson's textbook *Tokamaks.* NeoS is Olivier Sauter's package using a set of fitting coefficients to Fokker-Planck results. NeoArt is the multi-species neoclassical code from Arthur Peeters. Here we do a simple comparison.

In a model using simple profiles and the equilibrium code BDSEQ (circular boundary surface, shifted-circle flux surfaces) we compare the run of the bootstrap current and conductivity in the two models as a function of ρ which is defined as the normalised toroidal flux radius `rho_tor_norm` in the CPO. An electron-proton plasma with equal temperatures and densities is assumed with

$$T = T_0 \exp(-8\rho^2/3) \qquad n = n_0 \exp(-8\rho^2/7) \qquad J_\varphi = -\frac{2B_0}{\mu_0 q_0}(1-\rho^2)\exp(-\rho^2)$$

with parameters

$$\begin{array}{lll} B_0 = -5.3\,\mathrm{T} & R_0 = 6.2\,\mathrm{m} & a = 2\,\mathrm{m} \\ T_0 = 10\,\mathrm{keV} & n_0 = 8.7\times 10^{19}\,\mathrm{m}^{-3} & q_0 = -1.5 \end{array}$$

Of course, $Z_{\mathrm{eff}} = 1$. Note that in the CPOs J_φ is R_0 times `jphi` (ie, it is the covariant component). The sign conventions for J_φ and B_0 follow ITER (out of the poloidal plane, on the right of the symmetry axis, from the point of view of an observer in the toroidal midplane outside the tokamak).

The necessary CPO input to BDSEQ is

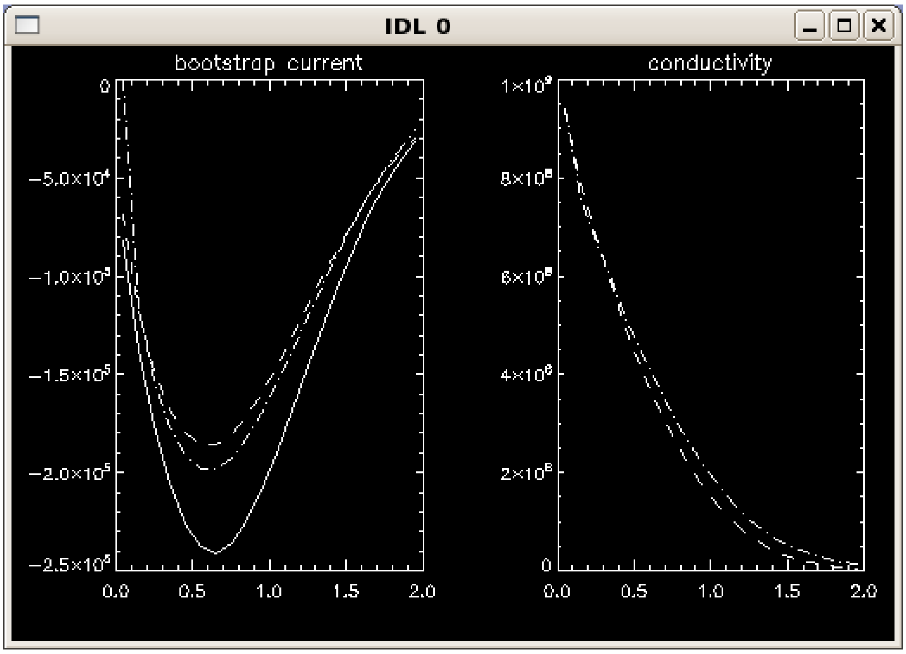
```
equilibrium%global_param%toroid_field%b0
equilibrium%global_param%toroid_field%r0
equilibrium%eqgeometry%a_minor
equilibrium%profiles_1d%rho_tor
equilibrium%profiles_1d%pressure
equilibrium%profiles_1d%jphi
```

The first three are B_0, R_0, a, respectively, and `rho_tor` is ρa on the `coreprof` grid. The pressure and current are found from

$$\textbf{jphi} = R_0 J_\varphi \qquad \textbf{pressure} = 2nk_B T$$

also on the `coreprof` grid.

The following graph gives the results of the comparison. The solid lines are from NeoArt, the dashed ones from NeoWes, and the dot-dashed ones from NeOS. In the context of such a circular model the results are in good agreement. On the conductivity, we don't have the one from NeoArt yet so the other two are shown.



last update: 2012-03-28 by bscott

8.9 Neoclassical Diffusivity Comparison

8.9.1 The Models

NeoWes is a simple neoclassical module intended for circular models, using a set of formulae from Wesson's textbook *Tokamaks*. NClass is Wayne Houlberg's code, well known as a standard tool. NeoArt is the multi-species neoclassical code from Arthur Peeters. Here we do a simple comparison of the electron and ion diffusivities using the IMP4 Shot 1 Run 1 base case (pure electron-deuterium plasma).

The equilibrium is re-done with BDSEQ, a simple model of circular boundary surface, shifted-circle flux surfaces, since some newer equilibrium CPO elements are needed. Hence only the profiles and a, R_0, and B_0 are used from the database.

We compare the run of the particle and heat diffusivities with toroidal flux radius. The density and temperature profiles are shown, and q goes from about -1.5 to -3.3. The UALPython actor was used to do the plots, which are shown for each neoclassical code. There appears to still be a problem with this implementation of NClass.

8.10 Auxiliary IMP4 Actors

8.10.1 Where to get them

These are located on Gforge in kepleractors/tags/4.10b/imp4/ and kepleractors/trunk/4.10b/imp4/ where the number refers to UAL version and will update in step with the UAL. Most up to date for developers: the versions in /pfs/home/bds/public/4.10b.10_actors which are ready for import (latest: 16h00 Thu 26 Mar 2015). For interpolation purposes rho tor norm must be set and filled.

8.10.2 IMP4DV

Purpose: accept coretransp fluxes and fill diff_eff and vconv_eff fields

- inputs: equilibrium, coreprof, coretransp
- output: coretransp
- no parameters

8.10.3 IMP4imp

Purpose: fill the impurity fields, diff_eff and vconv_eff for nz_transp (dynamical alignment rules, use D for electrons and V to set ambipolarity)

- inputs: coreprof, coreimpur, coretransp
- output: coretransp
- no parameters

9 IMP5

9.1 IMP5 - Heating, current drive and fast particles

The aim of the Integrated Modelling Project #5 on Heating, Current Drive and Fast Particles is to develop a package of codes for prediction (29) and interpretation of heating, current drive and fast particle effects. The areas to be covered include ECRH, ICRH, NBI, LH, alpha particles and fast particle interaction with instabilities. The ultimate goal is to enable self-consistent simulation of heating and current drive in the presence of fast particle instabilities, especially for ITER.

A self-consistent treatment of all possible heating scenarios is a very challenging problem with current modelling capabilities. Owing to the vastly different time scales for wave propagation and the evolution of distribution functions, simulations of heating and current drive can, in general, be obtained by combining codes solving the wave fields at time slices with codes evolving the distribution functions between the time slices. The goal is to have at least one module for each physics area at two levels: one basic and less detailed enabling fast computations, and one advanced, but computationally expensive, enabling detailed computations of the distribution functions of electrons and ions during heating and current drive, ultimately incorporating non-linear effects of instabilities and their redistribution fast ions.

In 2010, the work on adapting code modules to ITM requirements will be consolidated such that essential modules are available for providing the necessary input to the transport solver ETS (IMP3 [580]). The data structures relating to the physics of Heating and Current drive and fast particle physics will be improved further. New modules will be considered and adapted to the ITM standards. When more than one module of a certain type is available, work on cross verification (29) will start.

9.3.5 Tasks in the 2010 Work Programme

The list of IMP5 related tasks for 2010.

9.3.5.1 WP10-ITM-IMP5-ACT1

Topic: Adaptation of IMP5 codes for use with ITM tools

Priority Support Deliverables:

- The codes that will part of the IMP5 set during 2010 should be identified.

- For each code a schedule for release and other milestones associated with it should specified.

- A code under the ITM svn server adapted to ITM standards, i.e. communicating data via CPOs (29) .

- Documentation of the code including information on verification (29) or references to work where verification has been demonstrated.

- The codes participating in the benchmarking task will be adapted to the ITM data structures and ported on the ITM code platform.

9.3.6 Tasks in the 2011 Work Programme

9.3.6.1 WP11-ITM-IMP5-ACT1

Topic: Adaptation of codes for Heating, Current Drive and Fast Particle Physics for use with ITM tools

Subtask 1 - Priority Support Deliverables:

- Code adaptation up to creation of a Kepler actor (for new codes)

Subtask 2 - Baseline Support Deliverables:

- Code adaptation up to creation of a Kepler actor (for people finishing off their planned for 2010)

Subtask 3 - Priority Support Deliverables:

- Kepler actor and test workflow

- Code documentation for developers and maintainers, and User documentation (Phase IV)

- Adaptation to version 4.08c of the data structures; to be completed within 3 months from the release of version 4.08c of the data structures

9.3.6.2 WP11-ITM-IMP5-ACT2

Topic: Integration of IMP5 modules with the European transport Solver ETS

Priority Support Deliverables:

- Development of Composite Actors for coupling IMP5 codes to the ETS. – Develop composite actors for the ETS; – Develop workflows for testing the composite actors; – Develop standard test cases for the composite actors.

- Development of datajoiners, i.e. modules merging the information in IMP5 related CPOs. Develop datajoiners of two types to: – merge two CPOS of the same kind, e.g. from two wave codes writing the waves-CPO for EC and LH waves; – generate the coresource-CPO by merging the CPOs distribution, distsource and waves.

- Development of modules for workflow orchestration. The IMP5 composite actor should look the same for many types of scenarios. This means that for many ETS simulations not all codes should be run. These routines should provide decision on what codes need running in a specific ETS simulations, i.e. they should take CPO and Kepler parameters as input and output Kepler parameters. Note that these modules are only needed when they cannot be replaced by a simple KEPLER composite actor.

- Application, adaptation and development of the composite actors in 1. for integrated workflows suitable to cross-project integration efforts, e.g. coupling equilibrium reconstruction (from remote data via exp2itm) and HCD chain. – Develop composite actors and workflows for integration of ITM codes and testing. – Reports on testing of the composite actors and workflows.

9.3.6.4 WP11-ITM-IMP5-ACT4

Topic: Development and integration of models for synergies between heating schemes and self-consistent coupling of IMP5 heating codes

Subtask 1:

- Synergies: Fokker-Planck modeling including both sources of beam ions and alpha particle and interactions with ICRF and LH wave fields.

Subtask 2:

- Synergies: Fokker-Planck modeling including interactions with EC, LH and ICRF wave fields.

Subtask 3:

- Quasilinear coupling of wave and kinetic plasma model by inclusion of a non- Maxwellian in the plasma susceptibility. This includes both the evaluation of the dielectric response from a general distribution function taken from the DISTIRIBUTION CPO and adaptation of wave codes to use this response.

Priority Support Deliverables:

- Actors and source code with documentation; all stored under Gforge-svn. Documentation of tests verifying

9.4 List of IMP5 codes

The following list lists the codes and modules which are part of ITM-TF tasks and their responsible officers.
A number of IMP5 codes have projects on gforge [657].
Update the code status here [658].

9.4.1 Electron heating codes

9.4.1.1 EC wave codes

- TORAY-FOM, E. Westerhof, FOM (code status [659], codeparam [660])
- TORBEAM, E. Poli, IPP-Garching (code status [661])
- GRAY, L. Figini, ENEA-CNR (code status [662], gforge [663], codeparam [664])
- TRAVIS, N. B. Marushchenko, IPP-Greifswald (code status [665], gforge [666])

9.4.1.2 LH wave codes

- RAYLH, A. Cardinali, EURATOM-ENEA (code status [667])

9.4.1.3 Combined EC and LH wave codes

- C3PO, Y. Peysson, CEA (Cadarache) (code status [668])

9.4.1.4 Combined electron Fokker-Planck codes

- RELAX, E. Westerhof, FOM (code status [669])

[669] http://solps-mdsplus.aug.ipp.mpg.de:8080/ITM/specific_code_report?specific_codename=RELAX&SUBMIT=Submit+Query

- LUKE, Y. Peysson (code status [670], gforge [671])

9.4.1.5 LH coupling

- ALOHA, J. Hillairet, CEA (Cadarache) (code status [672], gforge [673])

9.4.1.6 Time domain wave codes

- FWTOR, C. Tsironis, Hellenic Association (code status [674], gforge [675])

9.4.2 Ion heating codes

9.4.2.1 Wave codes for ion cyclotron heating

- TORIC, R. Bilato, IPP-Garching (code status [676], gforge [677])
- EVE, R. Dumont, CEA (Cadarache) (code status [678], gforge [679])
- LION, O. Sauter, CRPP
- Cyrano, E. Lerche, ERM/KMS
- ICCOUP, T. Johnson, VR (gforge [680])

9.4.2.2 Fokker-Planck codes for ion cyclotron heating

- FPSIM, L.-G. Eriksson, EC (code status [681], gforge [682])
- SSFPQL, R. Bilato, IPP-Garching (code status [683])
- RFOF, T. Johnson, VR (gforge [684], documentation [685], codeparam [686])
- Stix_Redist, E. Lerche and D. Van Eester (gforge [687], codeparam [688])
- Stix_Disp, E. Lerche and D. Van Eester (gforge [689])

9.4.2.3 NBI sources for Fokker-Planck codes

- BBNBI (Beamlet-based NBI module of ASCOT), O. Asunta, TEKES (code status [690], gforge [691])
- NEMO, M. Schneider, CEA (Cadarache) (code status [692], gforge [693],
- SNBI (OAW NBI source), K. Schöpf, OAW (code status [694])

9.4.2.4 Nuclear sources (input for Fokker-Planck codes)

- Nuclearsim, T.Johnson, VR (gforge [695], codeparam [696])

9.4.2.5 NBI Fokker-Planck codes

- RISK, M. Schneider, CEA (Cadarache) (code status [697], gforge [698])
- NBISIM, T. Johnson, VR
- FIDIT, K. Schöpf, OAW (code status [699])

9.4.2.6 Advanced codes

(The following codes include either the synergy between IC and NBI heating, or include both wave field and Fokker-Planck solver)

- ASCOT, S. Sipila, TEKES (code status [700], gforge [701], codeparam [702])
- SPOT, M. Schneider, CEA (Cadarache) (code status [703], gforge [704])
- SELFO-light, T. Hellsten, VR (code status [705], gforge [706])

9.4.2.7 Orbit tracing codes

- SOFI, S. Sipila, TEKES (code status [707], gforge [708])
- OAW Orbit Following Monte Carlo, K. Schöpf, OAW (code status [709])

9.4.3 Fast particle codes

9.4.3.1 Codes for fast ion-MHD interactions

- LIGKA, P. Lauber, IPP-Garching (code status [710])
- MARS, G. Vlad, ENEA-Frascati (code status [711], gforge [712])
- HYMAGYC, G. Vlad, ENEA-Frascati (code status [713])
- HMGC, C. Di Troia, ENEA-Frascati (code status [714])
- LEMAN, W.A. Cooper, EPFL-CRPP (code status [715])

9.4.3.2 Runaway electrons

- ARENA, G. Pokol and G. Csepany (code status [716], gforge [717])

9.4.4 Code parameter documentation

9.4.4.1 addICant

This documentation is generated from the XML schema, the xsd-file, for the code parameters.

Description: IC antennas: parameters

Namespace:

9.4.4.1.1 Code parameter tree

Name	Type	Restrictions
/general	--Directory--	Frequency and power
frequency	float	frequency [Hz]
power	float	Coupled power [W]
/straps	--Directory--	Strap specific parameters; strap geometry asnd phasing
nstrap	integer	Number of straps
phase	FloatList	Feeding phase [rad]
phi_centre	FloatList	Toroidal angle of antenna position [rad]
width	FloatList	Strap width [m]
dist2wall	FloatList	Distance strap-wall [m]
ncoord_strap	integer	Number of points to describe the poloidal strap extension (?)
coord_strap_r	FloatList	R coordinate of strap position [m]

[710] http://solps-mdsplus.aug.ipp.mpg.de:8080/ITM/specific_code_report?specific_codename=LIGKA&SUBMIT=Submit+Query

[711] http://solps-mdsplus.aug.ipp.mpg.de:8080/ITM/specific_code_report?specific_codename=MARS&SUBMIT=Submit+Query

[712] https://gforge6.eufus.eu/project/marsgw/

[717] https://gforge6.eufus.eu/project/arena/

Name	Type	Restrictions
coord_strap_z	FloatList	Z coordinate of strap position [m]
verbosity	nonNegativeInteger	Regulates the amount of standard output. 0 - only error messages; 1 - give warnings messages; 2 - idenitify start and end of code; 3 - Main results; 4 - Detailed logging.

9.4.4.1.2 Locally defined types

Name	Type	Descriptions
FloatList	float	

---

last update: 2015-08-07 by dpc

9.4.4.2 addECant

This documentation is generated from the XML schema, the xsd-file, for the code parameters.

Namespace:

9.4.4.2.1 Code parameter tree

Name	Type	Restrictions
/mirror	--Directory--	
alpha	float	
beta	float	
x0	float	
y0	float	
z0	float	
/beam	--Directory--	
frequency	float	Min(<): 0
power	float	Min(<): 0
i_mode	integer	
w0_x	float	Min(<): 0
w0_y	float	Min(<): 0
dist_w0_x	float	
dist_w0_y	float	
spot_rot	float	
phase_rot	float	
verbosity	nonNegativeInteger	Regulates the amount of standard output. 0 - only error messages; 1 - give warnings messages; 2 - idenitify start and end of code; 3 - Main results; 4 - Detailed logging.

9.4.4.2.2 Locally defined types

Name	Type	Descriptions
nonNegativeInteger	integer	Min(<=): 0

last update: 2015-08-07 by dpc

9.4.4.3 nbifiller

This documentation is generated from the XML schema, the xsd-file, for the code parameters.

Namespace:

9.4.4.3.1 Code parameter tree

Name	Type	Restrictions
number_of_injectors	integer	Number of injector (vector length of mass, charge, power...)
r_inj_surface	FloatList	Major radius at the centre of the injection surface [m]
z_inj_surface	FloatList	Vertical coordinate at the centre of the injection surface [m]
phi_inj_surface	FloatList	Toroidal angle at the centre of the injection surface [rad]
tang_rad	FloatList	Tangency radius (major radius where the central line of a NBI unit is tangent to a circle around the symmetry axis)
angle	FloatList	Angle of inclination between a line at the centre of the injection unit surface and the horiontal plane
direction	integer	Direction of the beam seen from above the torus: -1 = clockwise; 1 = counter clockwise
div_vert	FloatList	Beam divergence for a unit in the vertical direction [rad]
div_horiz	FloatList	Beam divergence for a unit in the horizontal direction [rad]
focal_len_hz	FloatList	Horizontal focal length along the beam line [m]
focal_len_vc	FloatList	Vertical focal length along the beam line [m]
n_beamlet	integer	Number of beamlets
r_beamlet	FloatList	Major radius coordinate at the beamlet centre [m]
z_beamlet	FloatList	Vertical coordinate at the beamlet centre [m]
phi_beamlet	FloatList	Toroidal coordinate at the beamlet centre [rad]
tangent_radius_beamlet	FloatList	Tangency radius of the beamlet [m]
angle_beamlet	FloatList	Angle of inclination between the beamlet and the horiontal plane [rad]
power_fraction_beamlet	FloatList	Power fraction beamlet
verbosity	nonNegativeInteger	Regulates the amount of standard output. 0 - only error messages; 1 - give warnings messages; 2 - idenitify start and end of code; 3 - Main results; 4 - Detailed logging.

9.4.4.3.2 Locally defined types

Name	Type	Descriptions
FloatList	float	
int4geometrySelection	integer	Min(<=): 0

last update: 2015-08-07 by dpc

9.4.4.4 writeECant

This documentation is generated from the XML schema, the xsd-file, for the code parameters.

Namespace: `https://gforge6.eufus.eu/svn/imp5tool/trunk/cpogenerators/writeECant`

9.4.4.4.1 Code parameter tree

Name	Type	Restrictions
/mirror	--Directory--	
alpha	float	poloidal angle (deg)
beta	float	poloidal angle (deg)
x0	float	x0 (cm) at mirror
y0	float	y0 (cm) at mirror
z0	float	z0 (cm) at mirror
/beam	--Directory--	
frequency	float	frequency (GHz) Min(<): 0
power	float	injected power (MW) Min(<): 0
i_mode	integer	1=OM, 2=XM
w0_x	float	waist (cm) x axis Min(<): 0
w0_y	float	waist (cm) y axis Min(<): 0
dist_w0_x	float	mirror-w0x dist (cm), >0 towards plasma
dist_w0_y	float	mirror-w0y dist (cm), >0 towards plasma
spot_rot	float	spot ellipse rotation (deg)
phase_rot	float	phase ellipse rotation (deg)

last update: 2019-01-31 by g2dpc

9.4.4.5 writeICant

This documentation is generated from the XML schema, the xsd-file, for the code parameters.

Description: IC antennas: parameters

Namespace:

9.4.4.5.1 Code parameter tree

Name	Type	Restrictions
/general	--Directory--	Frequency and power

Name	Type	Restrictions
frequency	float	frequency [Hz]
power	float	Coupled power [W]
/straps	--Directory--	Strap specific parameters; strap geometry asnd phasing

last update: 2014-12-19 by tjohnson

9.4.4.9 cyrano

This documentation is generated from the XML schema, the xsd-file, for the code parameters.

Namespace:

9.4.4.9.1 Code parameter tree

Name	Type	Restrictions
/cyrano	--Directory--	
Npol	integer	Number of poloidal points
read_details	boolean	Testing equilibrium
total_power	float	Total RF Power [W]

last update: 2015-08-07 by dpc

9.4.4.10 lion

This documentation is generated from the XML schema, the xsd-file, for the code parameters.

Namespace:

9.4.4.10.1 Code parameter tree

Name	Type	Restrictions
COCOS_IN	integer	Expected Cocos number in the input CPOs
COCOS_OUT	integer	Requested Cocos number for the output CPOs
ACHARG	FloatList	The charge of each ion species, given in atomic units. The length of this vector should be NRSPEC
AD	FloatList	Coefficient for polynomial density profile
AHEIGT	float	HEIGHT OF 2-D PLOTS
ALARG	float	WIDTH OF 2-D PLOTS
AMASS	FloatList	The mass of each ion species, given in atomic units. The length of this vector should be NRSPEC
AMASSE	float	ATOMIC MASS OF ELECTRON
ANGLET	FloatList	Toroidal cuts, in degrees.
ANTRAD	float	ANTRAD-1.=DISTANCE ANTENNA-PLASMA
ANTRADMAX	float	
ANTUP	float	UPPER RIGHT POSITION OF TOP/BOTTOM ANTENNA
ANU	float	COLLISIONAL DAMPING NU/OMEGA
ARSIZE	float	SIZE OF ARROWS
ASPCT	float	INVERSE ASPECT RATIO FOR SOLOVEV EQUILIBRIU
ASYMB	float	SIZE OF SYMBOLS
ATE	FloatList	
ATI	FloatList	
ATIP	FloatList	
BNOT	float	MAGNETIC FIELD AT MAGNETIC AXIS (TESLA)

Name	Type	Restrictions
CENO	FloatList	DENSITIES FOR CONST BETA SCAN OF DKE STAB
CENDEN	FloatList	DENSITIES OF ION SPECIES AT MAGN.AXIS (M-3)
CENTE	float	ELECTRON TEMPERATURE AT MAGNETIC AXIS
CENTI	FloatList	ION TEMPERATURES AT MAGN.AXIS (EV)
CENTIP	FloatList	PERP.ION TEMPERATURES AT MAGN. AXIS (EV)
CEOMCI	FloatList	NORMALIZED ION CYCLOTRON FREQUENCIES
CPSRF	float	PSI AT PLASMA SURFACE
CURASY	FloatList	AMPLITUDE OF SIN ANTENNA CURRENT (HELICAL)
CURSYM	FloatList	AMPLITUDE OF ANTENNA CURRENT
DELTA	float	PHENOMENOLOGICAL DAMPING
DELTAF	float	FREQUENCY INCREMENT FOR FREQUENCY TRACE
ELLIPT	float	ELLIPTICITY SQUARED FOR SOLOVEV EQUILIBRIUM
EPSMAC	float	ROUND-OFF ERROR OF COMPUTER
EQALFD	float	PROFILE PARAMETER OF TOTAL MASS DENSITY
EQDENS	float	PROFILE PARAMETER OF TOTAL MASS DENSITY
EQFAST	float	PROFILE PARAMETER OF FAST PARTICLE DENSITY
EQKAPD	float	PROFILE PARAMETER OF TOTAL MASS DENSITY
EQKAPF	FloatList	PROFILE PARAMETER OF FAST PARTICLE DENSITY
EQKAPT	FloatList	Parameter describing the ion temperature profile; TI(PARALLEL) = CENTI(I) * (1.-EQTI(I)*S*S) **EQKAPT(I)
EQKPTE	float	PROFILE PARAMETER OF ELECTRON TEMPERATURE
EQTE	float	PROFILE PARAMETER OF ELECTRON TEMPERATURE
EQTI	FloatList	Parameter describing the ion temperature profiles; TI(PARALLEL) = CENTI(I) * (1.-EQTI(I)*S*S) **EQKAPT(I)
FEEDUP	float	POSITION OF UPPER RIGHT FEED OF T/B ANTENNA
FRAC	FloatList	MASS FRACTION OF ION SPECIES
FRCEN	FloatList	CENTER OF ION DENSITY PROFILE
FRDEL	FloatList	WIDTH OF ION DENSITY PROFILE
FREQCY	float	FREQUENCY OF GENERATOR (HZ)
OMEGA	float	NORMALIZED FREQUENCY (*RMAJOR/ALFV.SPEED)
QIAXE	float	1./Q(AXIS) FOR SOLOVEV EQUILIBRIUM
RMAJOR	float	MAJOR RADIUS (M)
SAMIN	float	INSIDE EDGE OF ANTENNA INSIDE PLASMA (S)
SAMAX	float	OUTSIDE EDGE OF ANTENNA INSIDE PLASMA (S)
SIGMA	float	NORM FACTOR FOR V-THEMAL (IONS)
THANT	FloatList	THANT(J) are angles given in degrees, with values between 0 and 360. THANT(J) are measured from the magnetic axis horizontal.
THANTW	float	THETA OF SADDLE COILS TOROIDAL SECTIONS

Name	Type	Restrictions
TIME_ITM	FloatList	Time for slicing ITM CPO data (s).
VBIRTH	float	THE BIRTH VELOCITY OF FAST PARTICLES [M/S]
WALRAD	float	DISTANCE WALL-MAGNETIC AXIS IN UNITS OF THE MINOR RADIUS IN THE Z=0 PLANE.
WNTDEL	float	THE TOROIDAL WAVENUMBER INCREMENT FOR TOROIDAL WN SCANS
WNTORO	float	THE TOROIDAL WAVE NUMBER.
LENGTH	integer	Number of elements of a matrix block
MANCMP	integer	Number of poloidal wave numbers for helical antennas
MEQ	integer	Equilibrium quantities (i,jchi),js=1,npsi+1 ; EQ(i,jchi,js)
MFL	integer	Lower m value for fourier analysis
MPOLWN	IntegerList	Poloidal wave numbers for helical antenna
NANTSHEET	integer	Number of antenna current sheets. For NANTSHEET>1, the "power at antenna" might be wrong ... and hopefully the "power at plasma surface" is right. The current sheets are placed equidistantly between ANTRAD and ANTRADMAX. The current distribution as function of theta is identical for all sheets.

Name	Type	Restrictions
NANTYP	integer	The variable 'nantyp' selects the type of antenna. (A) NANTYP=-1: "Helical volume antenna". Volume antenna currents in the plasma between s=SAMIN and s=SAMAX, directed along psi=const surfaces, defined by: "j_a = grad psi x grad sigma", with sigma(s,chi,phi) = H(s-SAMIN) * H(SAMAX-s) * (sum[j=1..MANCMP] { CURSYM(j)*cos(MPOLWN(j)*chi) + CURASY(j)*sin(MPOLWN(j)*chi) }) * exp{i*WNTORO*phi}. Note that in this case there is no antenna in the vacuum region: the vacuum contribution to the right- hand side is put to zero by setting SAUTR(j) to zero. (B) NANTYP = 1 ==== "Helical antenna". current sheet at a constant distance of the plasma surface. The currents are harmonic functions of the poloidal angle theta, with poloidal wavenumbers given by 'MPOLWN(J)': SAUTR(THETA) = SUM(J=1 TO MANCMP) OF CURSYM(J)*COS(MPOLWN(J)*THETA) + I*CURASY(J)*SIN(MPOLWN(J)*THETA). There are no feeders. (C) NANTYP = 2 ==== LFS or HFS antenna. Specified by the input parameters THANT(J), J=1,4 and CURSYM(1). THANT(J) ARE ANGLES GIVEN IN DEGREES, WITH VALUES BETWEEN 0 AND 360. THANT(J) ARE MEASURED FROM THE MAGNETIC AXIS HORIZONTAL. THE LFS OR HFS ANTENNA IS A CURRENT SHEET WHICH, BETWEEN THETA = THANT(2) AND THANT(3), IS AT A CONSTANT DISTANCE OF THE PLASMA SURFACE AND CARRIES CONSTANT PURE POLOIDAL CURRENTS : SAUTR(THETA) = CURSYM(1) BETWEEN THETA = THANT(1) AND THETA = THANT(2) AND THETA = THANT(3) AND THETA = THANT(4) ARE THE FEEDERS, WHERE THE DISTANCE FROM THE PLASMA SURFACE INCREASES SMOOTHLY UP TO THE WALL SURFACE. THE LFS ANTENNA EXTENDS ACROSS THE THETA=0 LINE. THEREFORE THANT(3) < THANT(4) < THANT(1) < THANT(2). THE HFS ANTENNA CANNOT CROSS THE THETA=0 LINE. THEREFORE THANT(1) < THANT(2) < THANT(3) < THANT(4). THE SELECTION OF EITHER LFS OR HFS ANTENNA AUTOMATIC : THANT(3).LT.THANT(2) SELECTS LFS ANTENNA THANT(2).GT.THANT(3) SELECTS HFS ANTENNA NOTE THAT WE MUST HAVE THANT(1) < THANT(2) AND THANT(3) < THANT(4). (D) NANTYP = 3 ==== TOP/BOTTOM ANTENNA. THE ANTENNA SURFACE IS UP/ DOWN SYMMETRIC, AT CONSTANT DISTANCE OF THE PLASMA SURFACE BETWEEN THETA = ANTUP AND THETA = PI - ANTUP. THE CURRENTS ARE DEFINED AS FOR NANTYP = 1. (E) NANTYP = 4 ==== SADDLE COIL ANTENNA. THE ANTENNA SURFACE IS THE SAME AS FOR THE HELICAL ANTENNA: CURRENT SHEET AT A DISTANCE ANTRAD-1 OF THE PLASMA SURFACE. THE CURRENT = CURSYM(1) IN [THANT(1),THANT(2)] AND IN [THANT(3),THANT(4)], SMOOTHLY DECAYING TO ZERO NEAR THANT(J).
NANT_ITM	integer	0 (default), 1 if uses antennas_in and antennas_tools to define the antenna geometry
NBCASE	integer	Number of cases for the constant beta scan
NBTYPE	integer	TYPE OF CONSTANT BETA SCAN: 1 == n_i(o) IS VARIED (CEN0()), T_i(o) and T_e(o) as 1/n_i(o), Bo is kept constant. ==> v_A(o) is varied 2 == n_i(o) IS VARIED (CEN0()), Bo as sqrt(n_i(o)), ==> v_A(o) constant T_i(o) and T_e(o) are kept constant 'NLTTMP': .F. ==> SWITCH OFF TTMP BY PUTTING B_PARALLEL TO 0 IN DKE POWER EXPRESSIONS.
NCHI	integer	Number of poloidal intervals all around (please note that in LION this becomes variable NPOL, and that NCHI is defined in lion as the number of poloidal intervals in the upper half-plane)
NCOLMN	integer	Rank of a matrix block
NCONTR	integer	Number of contour lines
NCUT	integer	Number of toroidal cuts for plots
NDA	integer	Matrix a I/O channel
NDARG	integer	Argument for polynomial density profile

Name	Type	Restrictions
NDDEG	integer	Degree of polynomial density profile
NDENS	integer	Selects type of density profile
NDES	integer	R,Z coordinates and normals i/o channel
NDLT	integer	Decomposed matrix L,D,U I/O channel
NDS	integer	Solution vector
NELDTTMP	integer	Type of model for Electron Landau and TTMP damping 1 ==> Additional damping term in epsilon_{perp,perp}, with k_perp from Fast Wave dispersion relation; see WEPSEL in subroutine QUAEQU 2 ==> Additional damping term propto B_parallel, consistent in the weak variational form; see WEPSTTMP in subroutine QUAEQU, CONST1,2,3, etc. Factor 1/2 for combined ELD and TTMP of fast waves
NELDTTMPCOR	integer	Correction (perturbative) to electron Landau and TTMP damping diagnostics 0 (default): do not correct 1 : do the correction; option valid only for NELDTTMP=1; WARNING: the powers will not be consistent
NFAKAP	integer	Number of fast particle density profiles
NHARM	integer	Maximum absolute value of the harmonic number used in constructing the warm plasma dielectric tensor, i.e. the tensor includes components for harmonic numbers from -NHARM to +NHARM.
NPLTYP	integer	2-D GRAPHICAL PLOTS SELECTED IN NLPL05(4): - IF NPLTYP = 1 (DEFAULT): PREPARES PLOT FILES FOR USE WITH THE GRAPHICAL PACKAGE BASPL: WRITES A FILE coords (TAPE18) OF (R,Z) COORDINATES OF MESH CELLS CENTERS AND A FILE fields (TAPE19) OF (R,Z) COMPONENTS OF E, POWER ABSORPTION DENSITY, NORMAL AND BINORMAL COMPONENTS OF E, NORMAL, BINORMAL AND PARALLEL COMPONEMTS OF B. THE PLOTS ARE THEN DONE WITH THE GRAPHICAL PACKAGE BASPL. IT ALLOWS TO MAKE COLOR PLOTS, ARROW PLOTS, CONTOUR PLOTS, ... INTERACTIVELY. - IF NPLTYP = 2 : PLOT FILE FOR USE WITH THE GRAPHICAL PACKAGE explorer: WRITES A FILE corfields (TAPE19) CONTAINING COORDINATES AND FIELDS.
NPOL	integer	Total number of chi intervals
NPRNT	integer	Line-printer output
NPSI	integer	Number of s intervals
NREAD	integer	-documentation missing-
NRSPEC	integer	Number of ion species
NRUN	integer	The number of runs for frequency traces
NSADDL	integer	SELECTS THE TYPE OF SADDLE COIL PHASING IN THE POLOIDAL PLANE. THIS IS DISCARDED UNLESS NANTYP = 4. NSADDL = 0 === ONLY 1 SADDLE COIL ANTENNA IS CONNECTED: BETWEEN THANT(1) AND THANT(2). NSADDL = 1 === 2 SADDLE COILS ARE CONNECTED. THE CONNECTION IS DONE IN OPPOSITE DIRECTIONS FOR THE 2 COILS, THUS DEFINING A PREDOMINANTLY 'M=1' ANTENNA CURRENT COMPONENT: (+-) PHASING. NSADDL = 2 === 2 SADDLE COILS ARE CONNECTED. THE CONNECTION IS DONE IN THE SAME DIRECTION FOR THE 2 COILS, THUS DEFINING A PREDOMINANTLY 'M=2' ANTENNA CURRENT COMPONENT: (++) PHASING. THIS IS THE DEFAULT VALUE.
NSAVE	integer	NAMELIST I/O CHANNEL
NSOURC	integer	NAMELIST I/O CHANNEL

Name	Type	Restrictions
NTEMP	integer	'EQTI()', EQKAPT()', 'NTEMP': SPECIFY THE ION PARALLEL AND PERPENDICULAR TEMPERATURE PROFILES [EV] : NTEMP = -2 ==> PROPORTIONAL TO SQRT(EQUILIBRIUM_PRESSURE) TI(PARALLEL) = CENTI(I) * SQRT (P/P_AXIS) NTEMP = -1 ==> POLYNOMIAL FUNCTION OF S**2 IF NDARG = 1 S IF NDARG = 2 TE/TI()/TIP() = CENTE/CENTI()/CENTIP() * (1. + SUM(J=1,NDDEG) {ATE/ATI/ATIP(J)*ARG**J}) NTEMP # -1 OR -2 ==> TI(PARALLEL) = CENTI(I) * (1.-EQTI(I)*S*S) **EQKAPT(I) (SUBROUTINE TEMPI) NTEMP = -2 ==> PROPORTIONAL TO SQRT(EQUILIBRIUM_PRESSURE) TI(PERP) = CENTIP(I) * SQRT (P/P_AXIS) NTEMP=-1 ==> POLYNOMIAL (SEE ABOVE) NTEMP # -2 ==> TI(PERP) = CENTIP(I) * (1.-EQTI(I)*S*S) **EQKAPT(I) (SUBROUTINE TEMPRP)
NTORSP	integer	The number of toroidal WN's for toroidal WN scans
NUMBER	integer	Run number
NVERBOSE	integer	Select verbosity of output to STDOUT
NVAC	integer	VACUUM QUANTITIES I/O CHANNEL
NLCOLD	boolean	Switch off electron Landau and TTMP damping of fast wave: If .TRUE. then no additionnal term in EPSILON_PERPPERP If .FALSE. then additionnal damping term in EPSILON_PERPPERP. Note that the alfven wave electron landau damping rate is evaluated as a diagnostic of the obtained solution irrespectively of the value of NLCOLE.
NLCOLE	boolean	Switch off electron Landau and TTMP damping of fast wave. If .TRUE. then no additionnal term in EPSILON_PERPPERP If .FALSE. then additionnal damping term in EPSILON_PERPPERP. Note that the alfven wave electron landau damping rate is evaluated as a diagnostic of the obtained solution irrespectively of the value of NLCOLE.
NLDIP	boolean	Selects monopole or dipole antenna. the dipole option has not been programmed yet. DEFAULT: FALSE , i.e. monopole.
NLDISO	boolean	Switch computation and diagnostics of the solution. If NLDISO=.TRUE. then the solution is computed everywhere. Diagnostics are performed, printed and/or plotted according to NLOTP5() and NLPLO5() (see below). With this option (which is the default) running the LION code requires scratch disk space for matrix storage: 96 * NPSI * NPOL**2 (bytes) If NLDISO=.FALSE. then the solution is computed only at the plasma-vacuum interface. The only diagnostic is the total power, which is permanent output. It is correct as long as there is no source inside the plasma. No other diagnostics are perfomed, irrespectively of NLOTP5() and NLPLO5(). With this option the lion code does not use disk space for matrix storage, therefore the turnaround time is reduced.
NLPHAS	boolean	Switch poloidal phase extraction
NLFAST	boolean	If TRUE, then introduce fast particles
NLOTP0	boolean	General switch for line-printer output and graphics
NLOTP1	BooleanList	LINE-PRINTER OUTPUT FOR EQUILIBRIUM QUANTITIES (LION1); LENGTH 5.
NLOTP2	BooleanList	LINE-PRINTER OUTPUT FOR VACUUM QUANTITIES (LION2). (1) : GEOMETRICAL QUANTITIES AT PLASMA SURFACE. (2) : POSITIONS OF PLASMA SURFACE, ANTENNA AND WALL. (3) : ANTENNA CURRENT POTENTIAL VS CHI AND THETA. (4) : NON-HERMICITY OF VACUUM MATRIX. (5) :
NLOTP3	BooleanList	LINE-PRINTER OUTPUT FOR MATRIX CONSTRUCTION (LION3). LENGTH 2.
NLOTP4	BooleanList	LINE-PRINTER OUTPUT FOR MATRIX SOLVER (LION4). (1) : NAMELIST (2) : OHM-VECTOR (3) : SOLUTION AT PLASMA BOUNDARY (4) : (5) :

Name	Type	Restrictions
NLOTP5	BooleanList	LINE-PRINTER OUTPUT FOR SOLUTION DIAGNOSTICS (LION5). (1) : NAMELIST (2) : RADIAL POWER ABSORPTIONS AND OTHER DIAGNOSTICS (3) : EXTENDED OUTPUT OF RADIAL DIAGNOSTICS (4) : 2-D POWER ABSORPTION DENSITY (5) : 2-D POWER ABSORBED IN EACH CELL (6) : 2-D NORMAL COMPONENT OF POYNTING (7) : 2-D PERP COMPONENT OF POYNTING (8) : 2-D PARALLEL COMPONENT OF POYNTING (9) : (10) : 2-D REAL PART OF E-NORMAL (11) : 2-D REAL PART OF E-PERP (12) : 2-D IMAGINARY PART OF E-NORMAL (13) : 2-D IMAGINARY PART OF E-PERP (14) : 2-D POLARAZATION NORM OF E-PLUS SQUARED (15) : 2-D POLARIZATION NORM OF E-MINUS SQUARED (16) : ELECTRIC FIELD ON OUTER EQUATORIAL PLANE (CHI=0) (17) : (18) : POLOIDAL FOURIER COMPONENTS OF E-NORMAL IN THETA FOR M = 'MFL', MFL+1, .., MFU(=MFL+MD2FP1-1) (19) : POLOIDAL FOURIER COMPONENTS OF E-PERP IN THETA (20) : POLOIDAL FOURIER COMPONENTS OF E-NORMAL IN CHI (21) : POLOIDAL FOURIER COMPONENTS OF E-PERP IN CHI (22) : 2-D EPSILON SUB-N-N - N**2 / R**2 (23) : 2-D IMAGINARY PART OF EPSILON SUB N-N (24) : 2-D OMEGA - OMEGACI (25) : SHEAR ALFVEN FREQUENCIES (NEGLECTING TOROIDAL COUPLING; FOR SINGLE SPECIES PLASMA ONLY), FOR M = 'MFL', MFL+1, .., MFU(=MFL+MD2FP1-1) (26) : DENSITY, MINOR AND MAJOR RADIUS, IN NORMALISED AND S.I. UNITS, ON THE OUTER EQUATORIAL PLANE (CHI=0). (31) : POLOIDAL FOURIER COMPONENTS OF B_N IN THETA FOR M = 'MFL', MFL+1, .., MFU(=MFL+MD2FP1-1) (32) : POLOIDAL FOURIER COMPONENTS OF B_B IN THETA (33) : POLOIDAL FOURIER COMPONENTS OF B_PAR IN THETA (34) : POLOIDAL FOURIER COMPONENTS OF B_N IN CHI (35) : POLOIDAL FOURIER COMPONENTS OF B_B IN CHI (36) : POLOIDAL FOURIER COMPONENTS OF B_PAR IN CHI THE 2-D TABLES GIVE THE VALUES ON THE CENTERS OF THE CELLS OF THE (S,CHI) MESH. A LINE IN THE TABLE CORRESPONDS TO A PSI = CONST SURFACE. IT GOES FROM CHI=0 TO CHI=PI IN THE UPPER HALF-PLANE AND FROM CHI=PI TO CHI=2*PI IN THE LOWER HALF-PLANE. THE VALUES ARE NORMALIZED TO THEIR MAXIMUM VALUE. THE FIRST AND THE LAST LINES OF THE TABLES GIVE THE POLOIDAL NUMBERING OF THE CELLS. THE FIRST COLUMN GIVES THE RADIAL NUMBERING OF THE CELLS. ALL OUTPUT IS IN CODE-NORMALIZED UNITS UNLESS SPECIFIED.
NLPLO5	BooleanList	GRAPHICAL OUTPUT FOR LION5 (1) : GENERAL SWITCH FOR GRAPHICAL PLOTS (2) : RADIAL POWER ABSORPTION AND FLUX (3) : FAST ION BETA_CRITICAL AND P_DK(S). WRITES TABLES ON TAPE26 AND TAPE27 => MATLAB (plotfast.m AND plotpdks(.,.).m) (4) : 2-D GRAPHICAL PLOTS : - IF NPLTYP = 1 (DEFAULT): PREPARES PLOT FILES FOR USE WITH THE GRAPHICAL PACKAGE BASPL: WRITES A FILE coords (TAPE18) OF (R,Z) COORDINATES OF MESH CELLS CENTERS AND A FILE fields (TAPE19) OF (R,Z) COMPONENTS OF E, POWER ABSORPTION DENSITY, NORMAL AND BINORMAL COMPONENTS OF E, NORMAL, BINORMAL AND PARALLEL COMPONEMTS OF B. THE PLOTS ARE THEN DONE WITH THE GRAPHICAL PACKAGE BASPL. IT ALLOWS TO MAKE COLOR PLOTS, ARROW PLOTS, CONTOUR PLOTS, ... INTERACTIVELY. - IF NPLTYP = 2 : PLOT FILE FOR USE WITH THE GRAPHICAL PACKAGE explorer: WRITES A FILE corfields (TAPE19) CONTAINING COORDINATES AND FIELDS. (5) : POLOIDAL FOURIER COMPONENTS (CABS) OF E_n, E_b, B_n, B_b AND B_//. WRITES A TABLE ON TAPE25 => => MATLAB (plotfour.m).
NLTTMP	boolean	Switch on/off TTMP by putting B_parallel to 0 in DKE power expressions.
NITMOPT	integer	Uses ITM database: 0 (default) = no, 1 =reads from ITM, 10=writes on ITM, 11=reads and writes, 22=LION run as module within Kepler
NITMRUN	IntegerList	ITM run number
NITMSHOT	IntegerList	ITM shot number

9.4.4.10.2 Locally defined types

Name	Type	Descriptions

BooleanList	boolean	

last update: 2015-08-07 by dpc

9.4.4.11 icdep

This documentation is generated from the XML schema, the xsd-file, for the code parameters.

Description: ICRF wave absorption parameters for the waves-cpo generating code icdep

Namespace:

9.4.4.11.1 Code parameter tree

Name	Type	Restrictions
/absorption_geometry	--Directory--	Geometric parameters describing the absorption profiles
width_rho	float	Width of the absorption in rho_tor_norm
width_r	float	Width of the absorption in R [m]
width_z	float	Width of the absorption in Z [m]
/power_partition	--Directory--	Partition of the launched power absorbed on the different species
fract_eld_ttmp	float	Fraction of the power absorbed through Electron Landau Damping and Transit Time Magnetic Pumping
fract_coll2electrons	float	Fraction of the fast ion absorbed power that is transferred to the electrons
/wave_quantities	--Directory--	Properties of the wave field
n_phi	integer	Toroidal mode number
k_theta	float	Wave vector component in the poloidal (theta) direction [1/m]
k_rho	float	Wave vector component in the radial (rho) direction [1/m]
ratio_Eplus_Eminus	float	Ratio of the magnitude between E_plus and E_minus, i.e. the left and right hand polarised components
phase_Eplus_Eminus	float	Complex phase difference between E_plus and E_minus = log(E_plus / E_minus) [rad]

last update: 2012-03-28 by tjohnson

9.4.4.12 nuclearsim

This documentation is generated from the XML schema, the xsd-file, for the code parameters.

Description: Code parameters for Nuclearsim (nuclear reaction rates for thermal plasmas)

Namespace:

9.4.4.12.1 Code parameter tree

Name	Type	Restrictions
/select_output_species	--Directory--	
source_from_neutrons	boolean	If true, then the source rate of fusion/fission produced neutrons will be calculated
source_from_H	boolean	If true, then the source rate of fusion/fission produced protons will be calculated
source_from_D	boolean	If true, then the source rate of fusion/fission produced deutrons will be calculated
source_from_T	boolean	If true, then the source rate of fusion/fission produced tritons will be calculated
source_from_He3	boolean	If true, then the source rate of fusion/fission produced Helium-3 will be calculated
source_from_He4	boolean	If true, then the source rate of fusion/fission produced Helium-4 will be calculated
/output	--Directory--	Defining the formatting of the output distsource CPO
/output/markers	--Directory--	Defining the formatting of the output distsource markers
n_toroidal	integer	Number of grid point in the toroidal angle; used only if Markers are initialised on a grid.
n_angle1	integer	Number of grid point in the assimuthal angle of the spherical velocity space coordinate system (not field aligned); used only if Markers are initialised on a grid.
n_angle2	integer	Number of grid point in the non-assimuthal angle of the spherical velocity space coordinate system (not field aligned); used only if Markers are initialised on a grid.
n_skip_r	integer	Define the R-grid from equilibrium%profiles_2d%r(n_skip_r:n_skip_r:end) grid; used only if Markers are initialised on a grid.
n_skip_z	integer	Define the z-grid from equilibrium%profiles_2d%z(n_skip_z:n_skip_z:end) grid; used only if Markers are initialised on a grid.
initalisation_scheme	initalisation_scheme_domain	1: Initialise on a grid.
verbosity	integer	Specifies the verbosity of the output to stdout and stderr.

9.4.4.12.2 Locally defined types

Name	Type	Descriptions
initalisation_scheme_domain	integer	Min(<=): 1

last update: 2014-12-19 by tjohnson

9.4.4.13 nemo

This documentation is generated from the XML schema, the xsd-file, for the code parameters.

Description: Code parameters for Nemo (neutral beam deposition code)

Namespace:

9.4.4.13.1 Code parameter tree

Name	Type	Restrictions
/select_output_resolution	--Directory--	
n_out_profiles	integer_minInclusive_2	Resolution of the output 1D profiles
n_pitch_resol	integer_minInclusive_2	Resolution of the output pitch angle profile
n_output_2d_r	integer_minInclusive_2	R-resolution of the output (R,Z) 2D profiles
n_output_2d_z	integer_minInclusive_2	Z-resolution of the output (R,Z) 2D profiles
n_output_2d_f	integer_minInclusive_1	PHI-resolution of the output (R,Z,PHI) profiles
debug_mode	integer_minmaxInclusive_01	Flag for debug mode (0 = normal execution, 1 = debug mode)

9.4.4.13.2 Locally defined types

Name	Type	Descriptions
integer_minInclusive_1	integer	Min(<=): 1
integer_minInclusive_2	integer	Min(<=): 2
integer_minmaxInclusive_01	integer	Min(<=): 0 Max(>=): 1

---

last update: 2015-08-07 by dpc

9.4.4.14 StixReDist

This documentation is generated from the XML schema, the xsd-file, for the code parameters.

Namespace:

9.4.4.14.1 Code parameter tree

Name	Type	Restrictions
/stix_redist	--Directory--	
max_iterations	integer	Maximum number of iterations per magnetic surface
tolerance_Teff	float	Tolerance on Teff evolution to stop the iterative scheme
N_velocity_grid	integer	Number of points in velocity grid
target_ions	integer	Switch to choose between iterating on all ion species(=0) or on a single one(=ion_index)
use_internal_power	boolean	Switch for computing RF power absorption internally(=1) or importing it from CPOs(=0)
total_power	float	Total RF Power [W] (only used when use_internal_power=1)

---

last update: 2014-12-19 by tjohnson

9.4.4.15 nbisim

This documentation is generated from the XML schema, the xsd-file, for the code parameters.

Description: Code parameters for hcd2coresource

Namespace:

9.4.4.15.1 Code parameter tree

Name	Type	Restrictions
verbosity	nonNegativeInteger	Regulates the amount of standard output. 1 - only error messages and warnings; 2 - idenitify start and end of code; 3 - Main results; 4 - Detailed logging.

9.4.4.15.2 Locally defined types

Name	Type	Descriptions
positiveInteger	integer	Min(<=): 1
nonNegativeInteger	integer	Min(<=): 0

9.4.4.17 rfof

This documentation is generated from the XML schema, the xsd-file, for the code parameters.

Description: RFOF code parameters

Namespace:

9.4.4.17.1 Code parameter tree

Name	Type	Restrictions
/rfof_parameters	--Directory--	RFOF code parameters
/rfof_parameters/rfof_core_param	--Directory--	Contains all fields needed when coupling to RFOF
/rfof_parameters/rfof_core_param/assumptions	--Directory--	List of optional physics assumptions.
assume_static_resonance_position_during_RF_kick	boolean	If true then the RF intraction induces no spatial motion of the orbit during the wave-particle interaction (however the new drift orbit may have a different spatial extent)
use_drift_velocity_in_doppler_shift	boolean	If true then the Doppler shift due to the drift velocity is included in the resonance condition
use_parallel_velocity_in_doppler_shift	boolean	If true then the Doppler shift due to the parallel velocity is included in the resonance condition
assume_zero_larmor_radius_in_KPERPxRHO	boolean	If "true", then the finite larmor radius effects in the wave particle interaction are neglected
assume_kpar_is_nphi_over_R	boolean	If "true" then the parallel wave number of is nphi/R, otherwise the exact value is used
assume_zero_order_FLR_for_Pphi	boolean	Neglect finite larmor radius (FLR) corrections to P_phi
width_of_rf_resonance_layer	float	Width of the resonance layer as a fraction of the momentary major radius
/rfof_parameters/rfof_core_param/bounding_box	--Directory--	Bounding box in the poloidal cross section.
Rmin	float	Minimum major radius of the bounding box [m]
Rmax	float	Maximum major radius of the bounding box [m]
Zmin	float	Minimum vertical coordinate of the bounding box [m]
Zmax	float	Maximum vertical coordinate of the bounding box [m]
/rfof_parameters/rfof_core_param/resonance_memory	--Directory--	
nStoreTimes	integer	The number of time points to be stored in the resonance memory. These are used to extrapolate the orbit to the next upcoming resonance.
/rfof_parameters/rfof_core_param/IO_control	--Directory--	Controlling the output written to file
start_time_event_output	float	Time at which to start generating event-output files
output__2D_RZ_out	boolean	If true, then 2D output in (R,Z) will be generated for the density of abosorbed power and torque
NRedges_2DgridRZ	integer	Number of horizontal grid points in the 2D (R,z) grid
NZedges_2DgridRZ	integer	Number of vertical grid points in the 2D (R,z) grid
output__Orbit	boolean	If true, then output of the full orbits wil be generated and stored to file
MAX_number_of_points_stored_in_the_Orbit	integer	Maximum number of orbit points written to file

Name	Type	Restrictions
output__rf_kicks	boolean	If true, then a list of rf-kicks will be generated containing the location and strength of the kick
MAX_number_of_points_stored_in_rf_kick	integer	Maximum number of rf-kick points written to file
output__resonace_predictions	boolean	If true, then a list of rf-resonance preditions will be generated containing the present location and predicted location of the next resonance
MAX_number_of_points_stored_in_resonance_memory	integer	Maximum number of rf-resonance prediction points written to file
output__efield_normalization	boolean	If true, then a list of electric field normalization factors to file
MAX_number_of_points_stored_in_the_efield_normalization	integer	Maximum number of electric field normalizations (time-vector) written to output file
/rfof_parameters/rfof_core_param/quasilinear	--Directory--	Parameters describing the quasilinear model
MAX_relative_energy_kick	float	The I-perp kicks cannot be larger than this fraction of the input I-perp
/rfof_parameters/rfof_plasma_param	--Directory--	
/rfof_parameters/rfof_plasma_param/composition	--Directory--	
n_species	integer	Number of plasma ion species
amn	RFOF_FloatList	Atomic mass number
zn	RFOF_FloatList	Nuclear charge in atomic units
zion	RFOF_FloatList	Ionic charge in atomic units
/rfof_parameters/rfof_wave_param	--Directory--	
select_wave_from	integer	Select where the wave field should be taken from. 0 : wave generated from the data in parametric_wave 1 : wave read from ascii version of ITM cpos, written using write_cpo in the write_structures module. Filename is specified in ascii_itm_wave/filename_ascii_itm_wave.
/rfof_parameters/rfof_wave_param/parametric_wave	--Directory--	
nfreq	integer	Number of RF frequencies
nnphi	integer	Number of toroidal modes per frequency
RFpower	RFOF_FloatList	Power provided by the RF wave field
EfieldNormalisation	RFOF_FloatList	Normalisation factor for the strength of the RF wave field
ratioEPlusOverEMinus	RFOF_FloatList	Ratio between the left- and right-hand polarized electric wave field components
freq	RFOF_FloatList	RF wave frequency [Hz]
nphi	RFOF_IntegerList	Toroidal mode number
kperp	RFOF_FloatList	Perpendicular wave number [1/m]
verticalCentre	RFOF_FloatList	Vertical centre of the Gaussian RF wave field [m]
verticalWidth	RFOF_FloatList	Vertical width of the Gaussian RF wave field [m]

Name	Type	Restrictions
filename_lion_fields	string	Filename for lion corfields-file
/rfof_parameters/rfof_wave_param/ascii_itm_wave	--Directory--	
filename_ascii_itm_wave	string	Name of input file containing the ITM cpo waves in ascii format written using write_cpo in the write_structures module
/rfof_parameters/rfof_wrapper_param	--Directory--	
/rfof_parameters/rfof_wrapper_param/time_stepping	--Directory--	
NtimeSteps	nonNegativeInteger	Number of time steps (of standalone RFOF orbit tracer).
dt	RFOF_FloatPositive	Length of each time step [s].
nStoreOutTimes	integer	Number of time steps between which the output is accumulated before being written to file.
/rfof_parameters/rfof_wrapper_param/magnetic_field	--Directory--	
R0	float	Major radius of the plasma torus [m].
aminor	float	Minor radius of the plasma torus [m].
B0	float	Magnetic field strength att the magnetic axis [T].
q	float	Safety factor of the magnetic field.
/rfof_parameters/rfof_wrapper_param/markers	--Directory--	Defining the initial conditions for the markers in the RFOF wrapper
species_index	integer	Species index within the vector of particle species in the rfof_plasma_param/composition/*(), where * is amn, zn and zion. species_index has be in the range [1,rfof_plasma_param/composition/n_species]
weight	float	Marker weight
R	float	Initial major radius position of the marker [m]
z	float	Initial veritical position of the marker [m]
phi	float	Initial toroidal angle of the marker [rad]
charge	float	Charge of the marker [au]
mass	float	Mass of the marker [au]
E	float	Energy of the marker [eV]
xi	float	Pitch-angle of the marker [-]

9.4.4.17.2 Locally defined types

Name	Type	Descriptions
RFOF_FloatPositive	float	Min(<): 0.0
RFOF_FloatList	float	
RFOF_IntegerList	integer	

9.4.4.18 spot

This documentation is generated from the XML schema, the xsd-file, for the code parameters.

Description: Code parameters for Spot (Fokker-Planck code)

Namespace:

9.4.4.18.1 Code parameter tree

Name	Type	Restrictions
nperstep	integer_minInclusive_1	Number of markers to be created every big time step
nout1d	integer_minInclusive_2	Resolution of output 1D-profiles
nout2dr	integer_minInclusive_2	R Resolution of output 2D-profiles
nout2dz	integer_minInclusive_2	Z Resolution of output 2D-profiles
ksolver	integer_minmaxInclusive_12	Flag for internal solver: 1 = (R,Z) coordinates, 2 = (PSI,THETA) Boozer coordinates
bigwidth	float_minmaxInclusive_dot0001_dot01	Duration of a big time step (sec) for source update, RFOF E-field normalisation, etc
icrh_heating	integer_minmaxInclusive_01	Flag for ICRH heating (0 = NO, 1 = YES)
debug_mode	integer_minmaxInclusive_01	Flag for debug mode (0 = normal execution, 1 = debug mode)
source_flag	integer_minmaxInclusive_14	Flag for source option (0=Spot-generated-alphas, 2=Spot-generated-thermals-for-ICRH, 3=Spot-generated-NBI, 4=marker-source)
icrh_ion_mass	float_minmaxInclusive_mendeleiv	Mass of followed ICRH-accelerated ion (if any)
icrh_ion_charge	float_minmaxInclusive_mendeleiv	Charge of followed ICRH-accelerated ion (if any)
kforce_xml	integer_minmaxInclusive_01	Flag to force the use of XML input file for ICRF heating (when = 1)

9.4.4.18.2 Locally defined types

Name	Type	Descriptions
integer_minInclusive_1	integer	Min(<=): 1
integer_minInclusive_2	integer	Min(<=): 2
integer_minmaxInclusive_12	integer	Min(<=): 1 Max(>=): 2
integer_minmaxInclusive_14	integer	Min(<=): 1 Max(>=): 4
integer_minmaxInclusive_01	integer	Min(<=): 0 Max(>=): 1
float_minmaxInclusive_dot0001_dot01	float	Min(<=): 1.e-4 Max(>=): 0.1
float_minmaxInclusive_mendeleiv	float	Min(<=): 1.0 Max(>=): 300.0

9.4.4.19 spot_rfof

This documentation is generated from the XML schema, the xsd-file, for the code parameters.

Description: Code parameters for Spot (Fokker-Planck code)

Namespace:

9.4.4.19.1 Code parameter tree

Name	Type	Restrictions
nperstep	integer_minInclusive_1	Number of markers to be created every big time step
nout1d	integer_minInclusive_2	Resolution of output 1D-profiles
nout2dr	integer_minInclusive_2	R-Resolution of output 2D-profiles
nout2dz	integer_minInclusive_2	Z-Resolution of output 2D-profiles
ksolver	integer_minmaxInclusive_1_2	Flag for internal solver: 1 = (R,Z) coordinates, 2 = (PSI,THETA) Boozer coordinates
bigwidth	float_minmaxInclusive_0.0001_to_0.1	Duration of a big time step (sec) for source update, RFOF E-field normalisation, etc
icrh_heating	integer_minmaxInclusive_0_1	Flag for ICRH heating (0 = NO, 1 = YES)
debug_mode	integer_minmaxInclusive_0_1	Flag for debug mode (0 = normal execution, 1 = debug mode)
source_flag	integer_minmaxInclusive_1_4	Flag for source option (0=Spot-generated-alphas, 2=Spot-generated-thermals-for-ICRH, 3=Spot-generated-NBI, 4=marker-source)
icrh_ion_mass	float_minmaxInclusive	Mass of followed ICRH-accelerated ion (if any)
icrh_ion_charge	float_minmaxInclusive	Charge of followed ICRH-accelerated ion (if any)
kforce_xml	integer_minmaxInclusive_0_1	Flag to force the use of XML input file for ICRF heating (when = 1)
/rfof_parameters	--Directory--	RFOF code parameters
/rfof_parameters/rfof_core_param	--Directory--	Contains all fields needed when coupling to RFOF

9.4.4.20 ascot

This documentation is generated from the XML schema, the xsd-file, for the code parameters.

Description: Code parameters for ASCOT

Namespace: `http://solps-mdsplus.aug.ipp.mpg.de/wsvn/ascot/`

9.4.4.20.1 Code parameter tree

Name	Type	Restrictions
/nml_runtol	--Directory--	
options_tmax	FloatPositive	Particle tracing time (s)

Name	Type	Restrictions
binlim_dtglob	FloatNonNegative	Time step of ensemble time step model (s, 0 = disable model)
options_tinter	float	Time interval of particle data output (s, 0 to output every point, < 0 for no output)
options_cpumax	FloatPositive	Maximum allowed CPU time per particle (s) (0 = no CPU limit)
options_toler	FloatPositive	Relative error tolerance for guiding centre step
options_tbfrac	positiveInteger	Default time step is bounce time divided by this
options_colaac	FloatPositive	Allowed relative change in energy or absolute change in pitch per time step due to collisions
options_eleaac	FloatPositive	Allowed relative change in parallel velocity per time step due to the toroidal or parallel electric field
options_difaac	FloatPositive	Allowed change in rho per time step relative to the banana width due to radial diffusion
options_elhaac	FloatPositive	Allowed relative change in parallel momentum per time step caused by parallel momentum diffusion due to LH wave (for electrons)
options_ilhaac	FloatPositive	Allowed relative change in perpendicular energy per time step, caused by LH wave (for ions)
options_icraac	FloatPositive	Allowed relative change in energy per time step caused by IC wave (for ions)
options_intact	IntegerList	Particle-background interaction mechanisms (1=active, 0=inactive): intact(1) - toroidal (1) or parallel (2) electric field; intact(2) - pitch collisions; intact(3) - energy collisions; intact(4) - anomalous radial diffusion: 0 = no radial diffusion, 1 = constant diffusion coefficient, 2 = microturbulence model by Hauff et al; intact(5) - parallel momentum diffusion caused by LH wave (for electrons); intact(6) - perpendicular energy and radial diffusion caused by LH wave (for ions); intact(7) - velocity component change caused by IC wave (for ions); intact(8) - charge exchange (CX) collisions; intact(9)...intact(10) not in use.
options_quitcr	FloatList	End criteria (1=active, 0=inactive): quitcr(1) - time maximum per particle exceeded; quitcr(2) - CPU time maximum per particle exceeded; quitcr(3) - quitcr(3) * local thermal energy reached; quitcr(4) - hit the wall or a divertor target; quitcr(5) - escaped from plasma; quitcr(6) - quitcr(6) orbits calculated; quitcr(7) - quitcr(7) keV particle energy reached; quitcr(8)...quitcr(10) not in use
options_acc	IntegerBinary	Interaction acceleration on/off (1/0)
options_relat	IntegerBinary	Relativistic / classical treatment (1/0)za
options_icoord	IntegerBinary	Coordinate system: 0 = Cartesian everywhere, 1 = Boozer inside plasma, Cartesian outside
options_imeth	IntegerBinary	GC orbit integration method (only affects integration in Boozer coordinates, Cartesian always uses RK5): 0 = 4th order Runge-Kutta, no error monitoring; 1 = 5th order Runge-Kutta with error monitoring; (2 = Bulirsch-Stoer with error monitoring - not tested!)
options_orbitmode	IntegerBinary	
options_wallmode	Integer012	
options_regenr	Integer012	
options_divorb	IntegerBinary	
options_iseed	positiveInteger	
options_iskip1	nonNegativeInteger	
options_iskip2	nonNegativeInteger	
maxwcol_pfilim	FloatPositive

/rfof_core_param/assumptions	--Directory--	List of optional physics assumptions.
simplify__static_resonance_position_during_RF_kick	boolean	If true then the RF intraction induces no spatial motion of the orbit during the wave-particle interaction (however the new drift orbit may have a different spatial extent)
simplify__drift_velocity_no_effect_on_resonance	boolean	If true then all term in the resonance condition involving the drift velocity are neglected
simplify__parallel_velocity_no_effect_on_resonance	boolean	If true then all term in the resonance condition involving the parallel velocity are neglected
simplify__assume_zero_larmor_radius_in_KPERPxRHO	boolean	If "true", then the finite larmor radius effects in the wave particle interaction are neglected
simplify__kpar_is_nphi_over_R	boolean	If "true" then the parallel wave number of is nphi/R, otherwise the exact value is used
width_of_rf_resonance_layer	float	Width of the resonance layer as a fraction of the momentary major radius
/rfof_core_param/bounding_box	--Directory--	Bounding box in the poloidal cross section.
Rmin	float	Minimum major radius of the bounding box [m]
Rmax	float	Maximum major radius of the bounding box [m]
Zmin	float	Minimum vertical coordinate of the bounding box [m]
Zmax	float	Maximum vertical coordinate of the bounding box [m]
/rfof_core_param/resonance_memory	--Directory--	
nStoreTimes	integer	The number of time points to be stored in the resonance memory. These are used to extrapolate the orbit to the next upcoming resonance.

Name	Type	Restrictions
/rfof_core_param/IO_control	--Directory--	Controlling the output written to file
start_time_event_output	float	Time at which to start generating event-output files
output__2D_RZ_out	boolean	If true, then 2D output in (R,Z) will be generated for the density of abosorbed power and torque
output__Orbit	boolean	If true, then output of the full orbits wil be generated and stored to file
MAX_number_of_points_stored_in_the_Orbit	integer	Maximum number of orbit points written to file
output__rf_kicks	boolean	If true, then a list of rf-kicks will be generated containing the location and strength of the kick
MAX_number_of_points_stored_in_the_rf_kick	integer	Maximum number of rf-kick points written to file
output__resonace_predictions	boolean	If true, then a list of rf-resonance preditions will be generated containing the present location and predicted location of the next resonance
MAX_number_points_stored_in_resonance_memory	integer	Maximum number of rf-resonance prediction points written to file

9.4.4.20.2 Locally defined types

9.5 Datastructures (CPOs)

This page give you overview information on the datastructures (CPOs (29)) that are most relevant for IMP5.

Detailed information on all ITM datastructures can be found here (5.6).

CPOs (29) for which IMP5 are responsible.

CPO	Description
antennas (type (7.9.3.1.20), fortran (7.9.3.2.3))	The antennas CPO describe of antennas used for IC, EC and LH heating and current drive. The data stored in the CPO includes both hardware descriptions, like the antenna geometry, settings like the power launched and the frequency. The antennas CPO may include the descriptions of multiple systems in each frequency range, i.e. we may have several IC antennas, several LH launcher and several EC systems.
launchs (type (7.9.3.1.37), fortran (7.9.3.2.20))	*WARNING, this CPO is under restructuring and the present version should NOT be used! (2014-03-17)* The idea of this CPO is to describe the coupling of LH waves.
waves (type (7.9.3.1.56), fortran (7.9.3.2.39))	The waves CPO describe wave fields, primarily those used for heating and current drive. The wave fields can be described in two diffferent form; either as a global wave fiedl calculated at every point in the devise, or as a set of beams, or rays.
nbi (type (7.9.3.1.42), fortran (7.9.3.2.25))	The NBI CPO describes the NBI (neutral beam injection) system. The main purpose of the CPO is to be used to calculate the neutrals that reach the plasma. The CPO includes both variable setting like the acceleration energy and the input power, as well as a description of the beam geometry. The geometry is separated into two levels, one describing including so called "beamlet groups" that form a type of focussed beam with a focal length. The second level is that every beamlet group includes individual "beamlets". Each of these beamlets originate form a small hole in the grounded grid. Since all particles coming out of one such hole has been accelerated by somewhere between 50keV and 1.5 MeV, they all have almost the same velocity vector. The tiny variations in this velocity vector has a Gaussian shape and is specified as the beamlet divergence.
distsource (type (7.9.3.1.29), fortran (7.9.3.2.12))	Source terms for kinetic plasma model; e.g. the source of neutral beam particles or alpha particles. This data should come from a beam deposition code and should serve as input to kinetic codes, e.g. Fokker-Planck codes.
distribution (type (7.9.3.1.28), fortran (7.9.3.2.11))	Distribution functions of particles involved in the heating. E.g. the velocity distribution function of fast ions/electrons driven by RF, or the distribution function of alpha particles, or beam injected ions. The CPO should be filled in by a kinetic code and provide heating and provide, e.g. heating and current drive for transport solvers.

Additional material about the IMP5 CPOs:

IMP5 CPOs (pdf [718]) (ppt [719]) from the General ITM meeting september 2010 in Lisbon.

CPOs (29) commonly used by IMP5 codes.

CPO	Description
equilibrium (type (7.9.3.1.32), fortran (7.9.3.2.15))	Magnetic equilibrium.
coreprof (type (7.9.3.1.24), fortran (7.9.3.2.7))	Profiles of densities, temperatures, flows,... in the plasma core.
coreprof (type (7.9.3.1.24), fortran (7.9.3.2.7))	Profiles of impurity densities... in the plasma core.
coreprof (type (7.9.3.1.24), fortran (7.9.3.2.7))	New in 4.10b! Fluid moments of non-thermal particles, e.g. densities, parallel and perpendicular pressure etc. The data is derived from the distribution CPO; it summarises the distribution CPO for e.g. transport codes, MHD codes, but can also be used in wave codes to simulate the wave absorption on fast-ion populations.
coresource (type (7.9.3.1.25), fortran (7.9.3.2.8))	Sources of particles, momentum and heat to ETS.

The IMP5 only uses certain parts of the CPOs defined above, see list of cpos-fields used by IMP5 codes (9.5.1).

9.5.1 CPOs used by IMP5

Here follows a preliminary lists of the cpo-fields used by most, but not all, IMP5 codes.

To identify the importance of a cpo-field there is a priority index in the table below. Here are the definitions of priority indexes:

0 = undefined priority
1 = high priority; required by imp5 actors
2 = low priority; recalculated in the code if not provided

[718] https://www.efda-itm.eu/ITM/imports/imp5/public/meetings/20100913-17_Lisbon/Talk_Johnson_CPOs_ITM-GM2010.pdf
[719] https://www.efda-itm.eu/ITM/imports/imp5/public/meetings/20100913-17_Lisbon/Talk_Johnson_CPOs_ITM-GM2010.ppt

3 = non-mandatory, but used when provided (e.g. plasma may be used, but if the field is not provided it assumed to be zero)

In the equilibrium CPO:

Priority	CPO-field	Used by codes	Comments
1	equilibrium(*)%global_param%mag_axis%position%r	Gray (9.4.1.1), Mars (9.4.3.1), Torbeam (9.4.1.1), BBNBI (9.4.2.3), Toray-FOM (9.4.1.1), TORIC (9.4.2.1), FWTOR (9.4.1.6)

last update: 2011-12-22 by tjohnson

9.5.2 Development of the IMP5 cpos for 4.10a

Below is a list of changes to the IMP5 CPOs and the state of the implementation and testing at the time of the last update (see the bottom of the page).

Contact persons: Thomas Johnson (4831).

9.5.2.1 Overview of main changes

There are two main changes for the 4.10a release:

- We have introduced the complex-grid structure (so called grid-cpo) for multidimensional arrays in waves, distsource and distribution. However, the old structures are kept to simplify the transition (since the 4.10a version is only for testing).
- A set of identifiers has been added to trace the dataflow from `antennas/nbi/nuclear reactions` to `waves/distsource/distribution`.

9.5.2.2 distsource

- Replace `source_mark` with the field `markers` of the complexType `weighted_marker`.

  Implemented : YES

- Replace `source_grid` with the complexgrid based representation `source_rate`.
  The new representation has two fields `grid` and `source_rate`.
  NOTE: `source_grid` has been kept to get a smooth transition to using `source_rate`.

  Implemented : YES

- The field `gyrosrc_type` previously appeared in several places along, but has now been replaced by a single field `distsource()%source()%gyro_type`.

  Fields removed: `distsource()%source()%source_grid%gyrosrc_type` and `distsource()%source()%source_mark%g`
  .

  Implemented : YES

- New element `source_id` for both identifying the origin of the source, and for identifying this source when used in `distribution`.

  See also the translation table (**??**). of the identifier part of source_id.

  Documentation: *List of identifiers for the source, in term the type and name of the injectors and reactions that provide the source, along with an index separating sources with the same name and type. Possible content for* *type: NBI or reaction names (see specifications on the ITM webpages); the field name should either be taken from* `nbi(*)%nbi_unit(*)%name` *, or describe the populations involved in the reaction, e.g. fast-thermal; the field index should separate different sources generated from a single injector or reaction. Vector(n_injectors_and_reactions)*

Background : The 4.09a version of the distsource CPO did not clearly stated where the source came from, i.e. it was not possible to trace from which NBI injector or nuclear reactions the source originated. For this reason the `source_id` has been introduced.

Implemented : YES

- A new complexType `line_src_prof` added for representating line-sources as profiles on a monotonic rho-coordinate.
  The source is described by its spatial location (R, Z, rho, theta) and its velocity components (energy, pitch, angular momentum).

  Note: Usually beamlines enters the plasma on the low field side and exits on the high field side. In this case the line has to be split into two (or more) line-sources, thus the lines-source is an array.

  Note: Primarily added to allow a simple coupling between NEMO and RISK

  Implemented : YES

9.5.2.3 distribution

- Two new elements `waves_id` and `source_id` for both identifying the wave fields and sources affecting the distribution function in `distri_vec` .
  Documentation for `wave_id` **:** *List all waves affecting the distribution, as specified in waves(*)%coherentwave(*)%wave_id*

  See also the translation table (**??**) for the identifier part of wave_id.

  Documentation for `source_id` **:** *List all neutral beam injectors and reactions contributing to the source, as specified in distsource(*)%source(*)%source_id. Vector(n_injectors_and_reactions)* See also the translation table (**??**) for the identifier part of source_id.

  Implemented : YES

- Change description of distri_vec. In 4.09a `distri_vec` is described as a vector of length `n_spec` , which is misleading. `distri_vec` should be a vector over sources, where each source can only represent a single species, while one species can appear in many sources. In the new version `distri_vec` is a vector of length `ndistri_vec`

  Implemented : YES

- Add new field `distribution(*)%distri_vec(*)%gyro_type` to separate gyro-centre and full orbit representations.

  Implemented : YES

- Add new field `distribution(*)%distri_vec(*)%global_param%n_particles` for the total number of particles in the distribution

  Implemented : YES

- Add new field `distribution(*)%distri_vec(*)%profiles_1d%dens` for the particle density of the distribution

  Implemented : YES

9.5.2.4 waves

- New element `wave_id` for both identifying the antenna driving a coherent-wave, and for identifying a coherent-wave when used in `distribution` and `coresource` .
  Documentation: *Identifier for the coherent-wave, in terms of the type and name of the antenna driving the wave and an index separating waves driven by the same antenna. Possible types: EC/LH/IC; the field name should include the name of the antenna as specified in either antennas(*)%ec_antenna%name, antennas(*)%ic_antenna%name, or antennas(*)%lh_antenna%name; the field index should separate different waves generated from a single antenna.* See also the translation table (**??**) for the identifier part of wave_id.

  Implemented : YES

- Replace `waves()%coherentwave()%local` and `waves()%coherentwave()%pol_decomp` with a grid-cpo representation.
The new representation has two fields: `grid` and `e_components` .
All wave field components previously available in `local` and `pol_decomp` are available in the `e_components` .

Note : `waves()%coherentwave()%local` and `waves()%coherentwave()%pol_decomp` are both kept to simplify the transition from 4.09b.

Implemented : YES

9.5.2.5 antennas

- Replace the array `antenna_unit` by introducing arrays of the fields `antenna_ec` , `antenna_lh` and `antenna_ic` .

  Implemented : YES

- Suggestion: adopt for compatability with reflectometry, e.g. allowing modulation of the frequency.

  Implemented : NO

- **Question** : Are the machine description fields in the `ec_antenna` correctly labeled, or should the machine description fields be more primitive/closer to the hardware parameters?

9.5.2.6 nbi

- Add a name for each injector unit.

  Implemented : YES

9.5.2.7 launchs

- **Question** : Is this CPO needed?
- Suggestion: Correct the name from launchs to e.g. launchers

  Implemented : NO

9.5.2.8 orbit

- **Question** : Is this CPO needed?
- Correct typo: orbit/orbitt_id; new name orbit/com

  Implemented : YES

- Change parameter name: orb_glob_dat; new name global_param

  Implemented : YES

- Change parameter name: orb_trace; new name trace

  Implemented : YES

- New parameter: toroidal angle

  Implemented : YES

- Replaced word *ion* with word *particle* throghout the documentation.

  Implemented : YES

9.5.2.9 utilities

- New complexType `weighted_markers` added, describing an array of weighted markers in N-dimension. This complexType is used in both distsource and distribution to represent the marker representations of both particle source and particle distributions.

  Implemented : YES

- New complexType `enum_instant` added, describing an array of weighted markers in N-dimension. Specifies a specific enumerated instans of an object or process in term of its type, name and an index. E.g. the input could be the wave with index=2, selected from all waves launched by the antenna with name=A2, where the antenna is of type=IC.

  Implemented : YES

---

last update: 2012-07-13 by tjohnson

9.5.3 The machine description shot database

This section describes a solution for how to automate the reading of machine description CPOs in Kepler. At some point ISIP will come with an elegant solution, but the ITM needs something right now (written 20130315!). Here one proposal is presented that has been implemented in Kepler.

The basis of the present solution is a new "Machine Description Shot Database" that is stored in the svn-repository

```
https://gforge6.eufus.eu/svn/itmshared/branches/machineDescriptionDatabase/
```

The actual data is stored in an xml-file:

```
xml/machineDescriptionDatabase.xml
```

formatted accoring to the schema:

```
xml/machineDescriptionDatabase.xsd
```

To types of tools have so far been developed to extract data from the database; an xslt-translation sheeth

```
xsl/machineDescriptionDatabase.xsl
```

and a python code based on xml-dom

```
xsl/*.py
```

The python code is built to translate from a tokamak-name and a tokamak-shot number to a UAL database element, described by the shot/run/user. This python code can then be used in the PythonActor in Kepler find the correct machine description files.

9.5.3.1 Composite actor for reading MD-shots

A composite actor has been developed that uses the database and a tokamak-shot and a tokamak-name, to read machine descriptions. The actor can be found in the machineDescriptionDatabase-repository

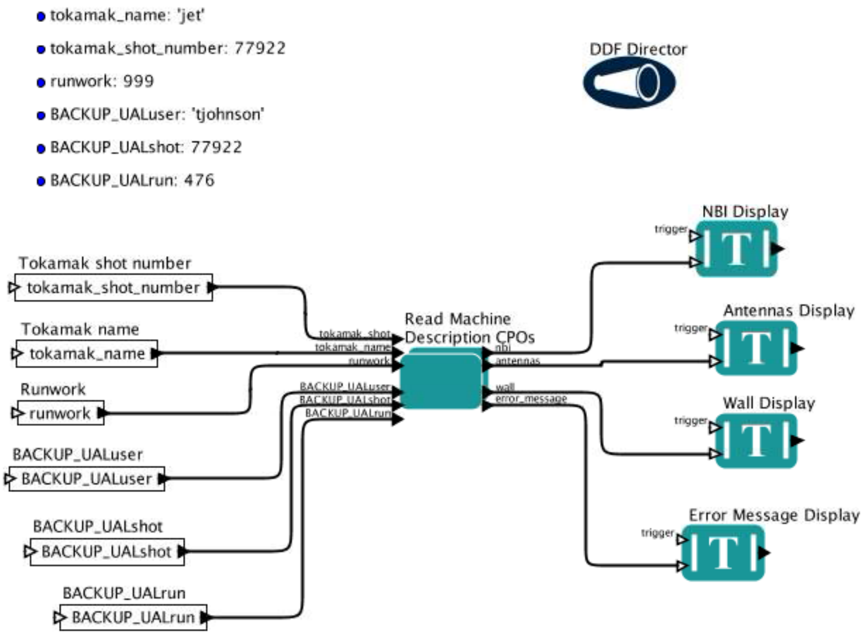
```
https://gforge6.eufus.eu/svn/itmshared/branches/machineDescriptionDatabase/
```

in the workflow xml-file

```
WORKFLOW/readFromMachineDescriptionDataBase.xml
```

9.5.3.1.1 Walk through the "Composite actor for reading MD-shots"

The workflow is an "as simple as possible" example of how to use the composite actor. Here the input parameters are defined and the composite actor is called. The returned data is then printed, see figure below.



Opening up the composite actor we find the PythonActor that generates the UAL-database info user/shot/run. The data is then forwarded to another composite actor `Select UAL run` , which also takes the input `BACKUP_UALuser` , `BACKUP_UALshot` and `BACKUP_UALrun` . The actor checks that the output from the Python is a valid run-number. If not, then return the `BACKUP_UAL...` data. Once the user/shot/run is decided these values are passed to the `UALinit` that reads the machine description CPOs from the UAL. See figures below.

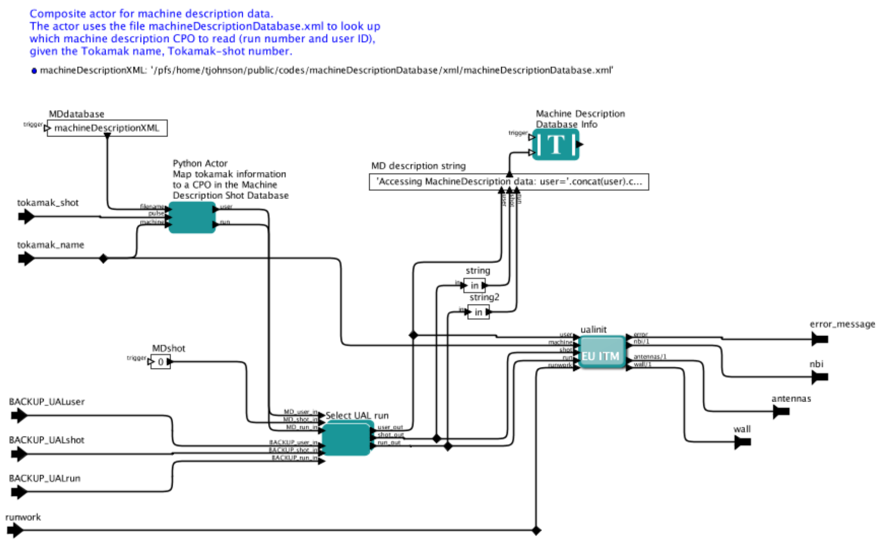


Figure below shows the structure of the `Select UAL run` composite actor.

9.6 Workflows

IMP5 have developed a number of Kepler (29) workflows.

Official workflows are stored under the GFORGE (29) project KeplerWorkflows [720]. To export a local copy of the IMP5 workflows, version 4.08a, 4.08b or 4.09a, from the repository

```
svn co https://gforge6.eufus.eu/svn/keplerworkflows/trunk/4.08a/imp5
```

```
svn co https://gforge6.eufus.eu/svn/keplerworkflows/trunk/4.08b/imp5
```

```
svn co https://gforge6.eufus.eu/svn/keplerworkflows/trunk/4.09a/imp5
```

More internal workflows useful for the IMP5 can be stored on the Gateway in the directory

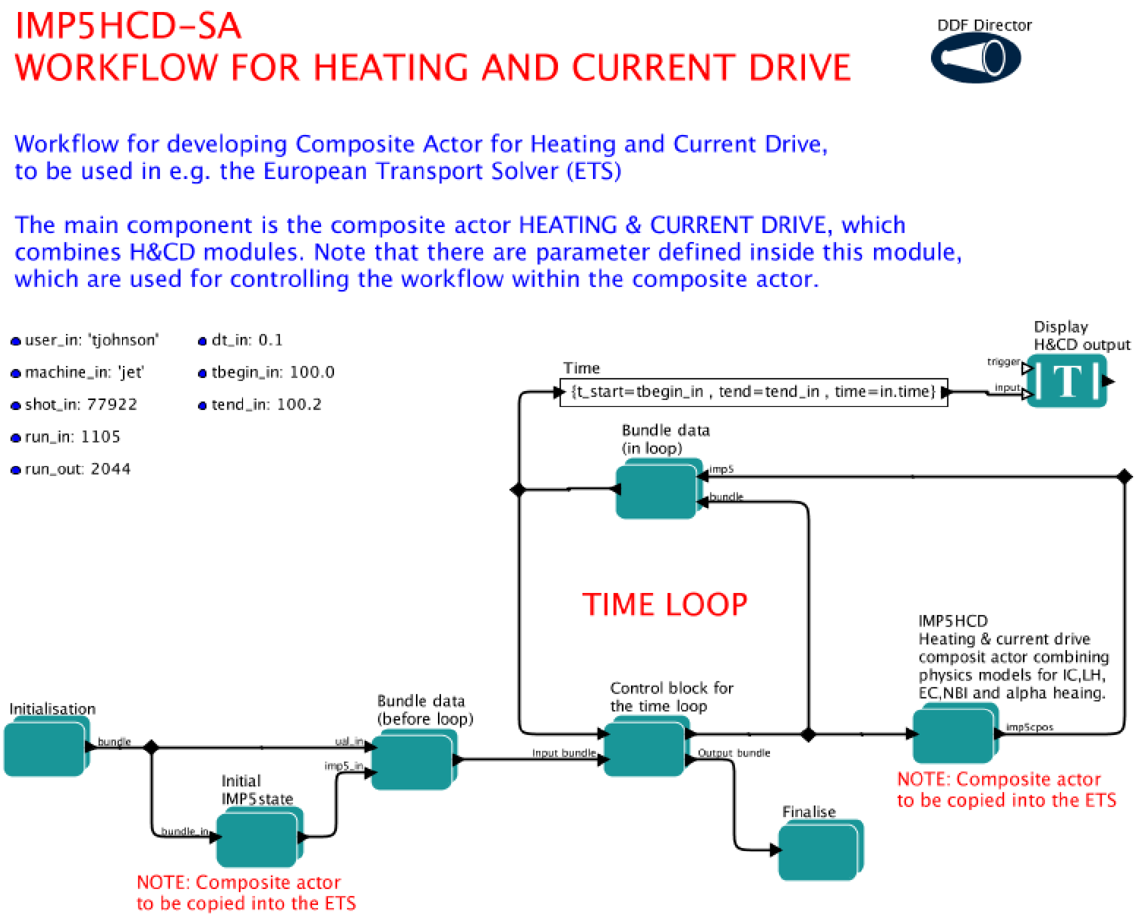
```
/afs/efda-itm.eu/imp5/user/wwwimp5/public/ITM_test/workflows/
```

9.6.1 The IMP5HCD-SA workflow

The IMP5HCD-SA (IMP5 Heating and Current Drive-Stand Alone) workflow is used for developing and testing the IMP5HCD Composite Actor [721]. The workflow runs the IMP5HCD Composite Actor for Heating and Current drive in a time loop using Equlibrium and Coreprof CPOs from the UAL and the NBI and Antenna CPOs provided by specialised CPO generators.

Contact persons: Thomas Johnson (4831) (skype: tjohn74) and Lorenzo Figini (4831)

[720] https://gforge6.eufus.eu/project/keplerworkflows/
[721] https://www.efda-itm.eu/ITM/html/.html#imp5_compositeactor_imp5hcd



9.6.1.1 How to configure IMP5HCD

To select **shot** and **run** numbers: double click on the Kepler-parameters `shot_in` and `run_in` and type your shot and run numbers values.

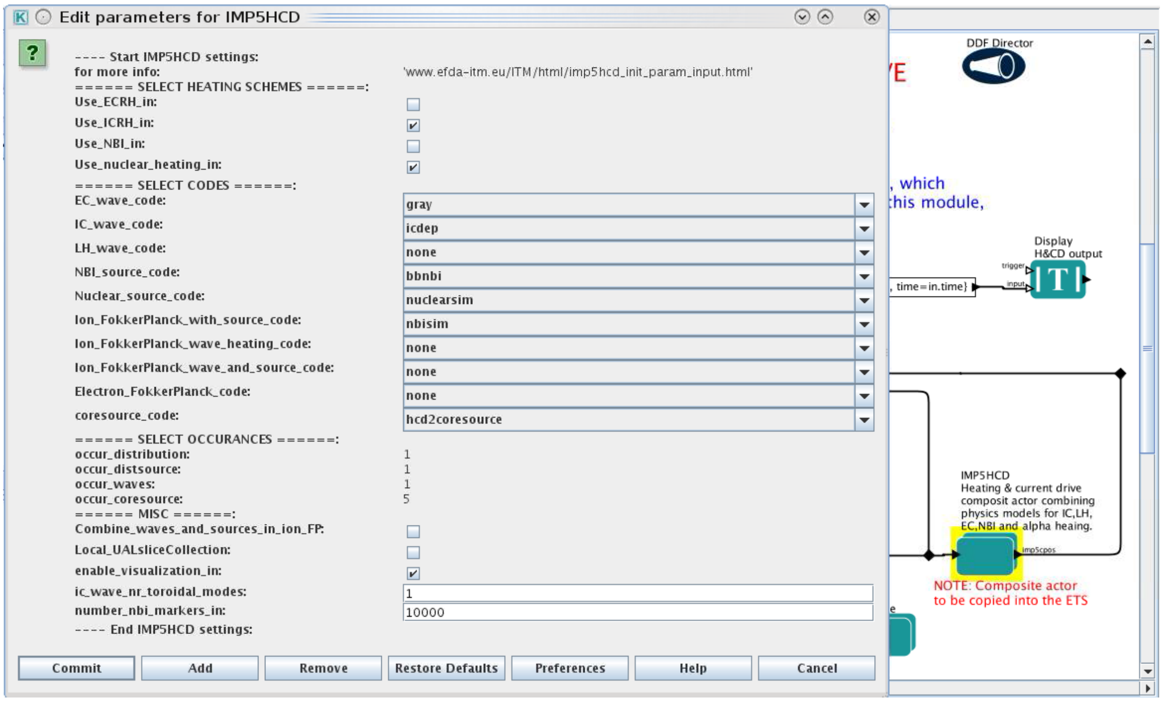
To select the time interval for the simulations: double click on the Kepler-parameters `dt_in` for the time step in seconds, `tbegin_in` for the start time, and `tend_in` for the end time of the simulation.

In addition you can select the run numbers for the output generated in each actor, `runwork_in` , and the run number to which the UALsliceCollector stores the data, `run_out`

All other parameters are set through the composite actors. All paramters that are specific to a single code are stored in the `code-parameters`

- Code parameters typically describeds parameters defining the grid to be used, selects optional assumptions to be made, the amount of debugging information to print to screen, etc.
- In addition there is a class of actors call CPO-generators that generates a CPO without any physics model, e.g. the actor `nbisetup` writes an nbi-CPO with a full description of the NBI-injector hardware and geometry. Many of these actors take their information from a list of code parameters.
- To edit the code parameters you open the composite-actors one by one until you reach the actor you wish to change; you double click on the actor; select `Code Parameters`).

Another type of parameters are supplied though local parameters inside the composite actors, see the figure below. In IMP5HCD such input parameters are store in two places; in the composite actors `IMP5HCD` and `Initial_IMP5_state` (found inside `H&CD INPUT`). This input allow you to select the heating schemes, physics codes and other workflow related options, e.g. the output occurances (which should not be touched at the moment as there are only a few occurances available and the current setting is almost the only possible one when running inside ETS-A).



9.6.1.2 Accessing the IMP5HCD-SA workflow

The IMP5HCD-SA workflow can be found in the GFORGE (29) repository KeplerWorkflows [722]. Here you find both the latest 4.10a version as well as the old 4.08a, 4.08b and 4.09a versions of the workflow, see trunk/4.08a/imp5, trunk/4.08b/imp5, trunk/4.09a/imp5 and trunk/4.10a/imp5. For checking out a local copy of the 4.10a version of the workflow:

```
svn co https://gforge6.eufus.eu/svn/keplerworkflows/trunk/4.10a/imp5/imp5hcd/  imp5hcd
```

Note that the actors used in the workflows has to be imported seperately. Importing these actors is automaized using make:

```
make import_actors
```

To open the workflow:

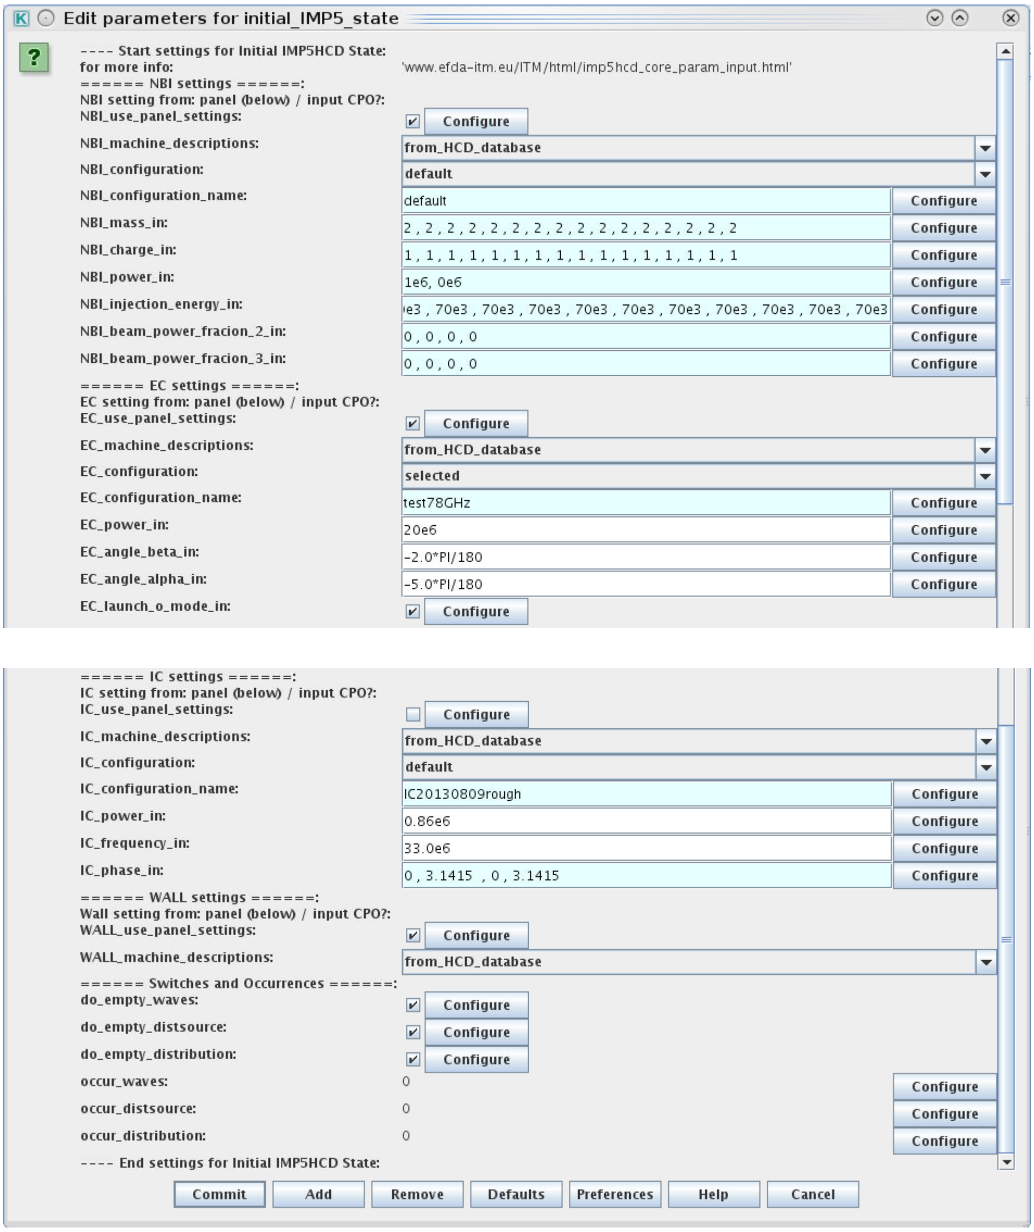
```
kepler.sh imp5hcd_sa.xml
```

OBSOLETE: Note from the IMP5HCD training, Garching 20130307 can be found here [723].

9.6.1.3 Parameter input to the Initial IMP5 State actor

When running IMP5HCD in either IMP5HCD_sa or in the ETS, the machine paramters can be assigned using the actor **Initial IMP5 State** . To control this assignment, double click to configure the actor and fill in the pop-up panel. For more details follow the links to the NBI settings (9.6.1.3.1), the EC settings (9.6.1.3.4), the IC settings (9.6.1.3.39) and the wall settings (9.6.1.3.51).

[722] https://gforge6.eufus.eu/project/keplerworkflows/
[723] https://www.efda-itm.eu/ITM/imports/imp5/public/training_imp5hcd_20130307.pdf



9.6.1.3.1 The NBI settings panel

The NBI settings panel is the list of variables following the line
`===== NBI SETTINGS =====`
Here is a description of the variables in this panel.

- **NBI_use_panel_settings:** If `TRUE` : use the NBI settings panel to configure the NBI system. If `FALSE` : ignore the NBI settings panel and use the input CPO.
- **NBI_machine_descriptions** : Select from where the NBI hardward description should be taken
  1. `from_input_CPO` : use the NBI hardware in the CPO provided by the UAL;
  2. `from_HCD_database` : uses the a HCD-database entry for the tokamak being simulated;
  3. `from_codeparameters` : specify the NBI settings in the codeparamters of the actor nbifiller.

  For all three options, dynamic quantities like power, injection energy etc. are always set according to the NBI panel settings.
- **NBI_configuration** : When using NBI data from `NBI_machine_descriptions=from_HCD_database` , then this parameter allow you to select different configurations: either you use the `default` or a `selected` configuration. In the latter case the name of the configuration is specified in **NBI_configuration_name** .

- **NBI_configuration_name** : When **NBI_machine_descriptions** = `from_HCD_database` and **NBI_configuration** = `selected` , then this parameter allow you to specify the name of your NBI configuration. The name is provided as a string and has to be one of the configurations in the list of NBI configurations (9.6.1.3.3). Note that the configuration is tied to the machine you are simulating, e.g. only ITER configurations can be used when simulating the ITER tokamak.
- **NBI_mass_in** : mass of injected species in atomic units. Vector over the beam injection units.
- **NBI_charge_in** : nuclear charge of injected species in atomic units. Vector over the beam injection units.
- **NBI_power_in** : power (W). Vector over the beam injection units.
- **NBI_injection_energy_in** : injection energy (J). Vector over the beam injection units.
- **NBI_beam_power_fraction_2_in** : fraction of the beam power injectedat half the nominal energy. Vector over the beam injection units.
- **NBI_beam_power_fraction_3_in** : fraction of the beam power injectedat a third of the nominal energy. Vector over the beam injection units.

9.6.1.3.2 Common NBI settings

Machine	mass	charge	power	injection_energy	beam_power_fraction_2	beam_power_fraction_3
ITER	2	1	33 MW	1 MeV	0	0
JET (16 PINIs)	2	1	25 MW (max 2.5 MW/PINI)	80-140 keV	0.15	0.08
MAST	2	1	4.0 MW	60 keV	0.15	0.08
AUG (PINI 1-4)	2	1	4 x 2.5 MW	60 keV	0.25	0.10
AUG (PINI 5-8)	2	1	4 x 2.5 MW	93 keV	0.25	0.10
TCV*	2	1	2.0 MW	25 keV	0.24	0.08
DEMO	2	1	90-200MW	1-2 MeV	0.0	0.0

* TCV has no beams installed, instead we use values from the scoping study for application NBI in TCV: http://www.sciencedirect.com/science/article/pii/S092037961100247X.

9.6.1.3.3 NBI configurations available in the HCD-database

Machine	Configuration name	Description
ITER	default	From the EDRG machine description database. Details: Unit 1 is On-axis and Unit 2 is Off-axis. Two gaussian components are assumed for the divergence : core (5mrad) and halo (15mrad). Unit R,Z,Phi calculated from avg of x,y,z coord. from datafiles of Otto. Tang_rad and angles from avg over beamlets angles. Beam divergences set to 5mrad assuming ideal core only component (halo 15mrad neglected). Past revisions of RUN2 contained 16 nbi units since we literally took the 4x4 layout of the cross section as with individual units. But there is a single power line and as such it is a single unit. Next datastructures should allow us to have type array to store arbitrary lenght r,z,phi,tang_rad,angle to describe any sort of layout in a coarse fashion. (2013)
JET	default	From the EDRG machine description database. Details: This file is valid for so-called UP1467 configuration (PINIs 1-4-6-7 of both Octants are upshifted with respect to their standard position). Excluding some few restart (duct conditioning) shots at the beginning of experiment campaigns (which should not be analysed anyway), this configuration is valid for the shotrange 52888-61931. The order of entries below is as follows: First Octant 4 PINI-1, PINI-2, ... PINI-8, then Octant 8 PINI-1, PINI-2, ..., PINI-8. For pow_frc_blt (fraction of power of a unit injected by a beamlet) it is assumed for the moment that all beamlets inject the same amount of power. (2013)
AUG	default	From the EDRG machine description database (2013). Details: This file does not contain details on the beamlets on each unit. We will have to get those later on.

9.6.1.3.4 The EC settings panel

The EC settings panel is the list of variables following the line
`===== EC SETTINGS =====`
Here is a description of the variables in this panel.

- **EC_use_panel_settings:** If `TRUE` : use the EC settings panel to configure the EC system. If `FALSE` : ignore the EC settings panel and use the input CPO.
- **EC_machine_descriptions** : Select from where the EC hardware description should be taken:

1. `from_input_CPO` : use the EC-configuration in the CPO provided by UAL-init;
2. `from_HCD_database` : use the a HCD-database entry for the tokamak being simulated;
3. `from_codeparameters` : specify the EC settings in the codeparamters of the actor addECant).
   For all three options, dynamic quantities like power, alpha, beta etc. are always set according to the NBI panel settings.

- **EC_configuration** : When using EC data from `EC_machine_descriptions=from_HCD_database` , then this parameter allow you to select different configurations: either you use the `default` or a `selected` configuration. In the latter case the name of the configuration is specified in **EC_configuration_name** .
- **EC_configuration_name** : When `EC_machine_descriptions=from_HCD_database` and `EC_configuration=selected` , then this parameter allow you to specify the name of your EC configuration. The name is provided as a string and has to be one of the configurations in the IMP5 EC-Antennas Database (9.6.1.3.7). Note that the configuration is tied to the machine you are simulating, e.g. only ITER configurations can be used when simulating the ITER tokamak.
- **EC_power_in** : power (W)
- **EC_angle_alpha_in** : Poloidal launching angle between the horizontal plane and the poloidal component of the nominal beam centerline (rad). Relation for to the component of the wave vector k: `tan(alpha)=-k_z/k_R`
- **EC_angle_beta_in** : Toroidal launching angle between the poloidal plane and the nominal beam centerline (rad). Relation for to the component of the wave vector k: `sin(beta)=k_phi/|k|`

9.6.1.3.5 Common EC settings

Machine	EC_power_in	EC_angle_alpha_in (stearable range)	EC_angle_beta_in (stearable range)
AUG (*/EC_1, */EC_2, */EC_3, */EC_4)	0.4 MW	(-4.3633231E-01 , 4.3633231E-01) rad	(-4.3633231E-01 , 4.3633231E-01) rad
AUG (*/EC_5, */EC_6, */EC_7, */EC_8)	0.7 MW	(-4.3633231E-01 , 4.3633231E-01) rad	(-4.3633231E-01 , 4.3633231E-01) rad
DEMO1	40 MW	- rad	- rad
ITER (2009/UL_LSM)	16 MW	(5.2359878E-01 , 9.5993109E-01) rad	(3.1415927E-01 , 3.1415927E-01) rad
ITER (2009/UL_USM)	16 MW	(6.1086524E-01 , 1.0471976E+00) rad	(3.4906585E-01 , 3.4906585E-01) rad
ITER (2011/EL_BOT)	8 MW	(-8.7266463E-02 , -8.7266463E-02) rad	(3.4906585E-01 , 6.9813170E-01) rad
ITER (2011/EL_MID)	8 MW	(0.0000000E+00 , 0.0000000E+00) rad	(-6.9813170E-01 , -3.4906585E-01) rad
ITER (2011/EL_TOP)	8 MW	(8.7266463E-02 , 8.7266463E-02) rad	(3.4906585E-01 , 6.9813170E-01) rad
ITER (2012/UL_LSM)	16 MW	(5.2359878E-01 , 9.5993109E-01) rad	(3.4906585E-01 , 3.4906585E-01) rad
ITER (2012/UL_USM)	16 MW	(6.1086524E-01 , 1.0471976E+00) rad	(3.4906585E-01 , 3.4906585E-01) rad
ITER (2013/EL_BOT)	8 MW	(-1.7453293E-01 , 4.3633231E-01 rad	(4.3633231E-01 , 4.3633231E-01 rad
ITER (2013/EL_MID)	8 MW	(0.0000000E+00 , 6.1086524E-01) rad	(4.3633231E-01 , 4.3633231E-01) rad
ITER (2013/EL_TOP)	16 Mw	(-3.4906585E-01 , 2.6179939E-01) rad	(-3.4906585E-01 , -3.4906585E-01) rad
JET	10 Mw	- rad	- rad

9.6.1.3.6 EC configuration available in the HCD-database

Machine	Configuration name	Description
AUG	LLLL	Official AUG antenna configuration #1 .Provided by Joerg Stober and Walter Kasparek. Gyrotrons configuration: f(EC_5)=105 GHz, f(EC_6)=105 GHz, f(EC_7)=105 GHz, f(EC_8)=105 GHz. NOTE: Anyone who wants to use the ITM database to plan EC experiments on AUG should get in contact with Joerg Stober, to check that the assumptions they have done are consistent.
AUG	LLLH	Official AUG antenna configuration #2. Provided by Joerg Stober and Walter Kasparek. Gyrotrons configuration: f(EC_5)=105 GHz, f(EC_6)=105 GHz, f(EC_7)=105 GHz, f(EC_8)=140 GHz. NOTE: Anyone who wants to use the ITM database to plan EC experiments on AUG should get in contact with Joerg Stober, to check that the assumptions they have done are consistent.
AUG	LLHL	Official AUG antenna configuration #3. Provided by Joerg Stober and Walter Kasparek. Gyrotrons configuration: f(EC_5)=105 GHz, f(EC_6)=105 GHz, f(EC_7)=140 GHz, f(EC_8)=105 GHz. NOTE: Anyone who wants to use the ITM database to plan EC experiments on AUG should get in contact with Joerg Stober, to check that the assumptions they have done are consistent.

Machine	Configuration name	Description
AUG	LLHH	Official AUG antenna configuration #4. Provided by Joerg Stober and Walter Kasparek. Gyrotrons configuration: f(EC_5)=105 GHz, f(EC_6)=105 GHz, f(EC_7)=140 GHz, f(EC_8)=140 GHz. NOTE: Anyone who wants to use the ITM database to plan EC experiments on AUG should get in contact with Joerg Stober, to check that the assumptions they have done are consistent.

9.6.1.3.39 The IC settings panel

The IC settings panel is the list of variables following the line
`===== IC SETTINGS =====`
Here is a description of the variables in this panel.

- **IC_use_panel_settings** : If `TRUE` : use the IC settings panel to configure the IC system. If `FALSE` : ignore the IC settings panel and use the input CPO.
- **IC_machine_descriptions** : Select from where the IC hardware description should be taken
  1. `from_input_CPO` : use the IC hardware in the CPO provided by the UAL;
  2. `from_HCD_database` : use the a HCD-database entry for the tokamak being simulated;
  3. `from_codeparameters` : specify the IC settings in the codeparamters of the actor addICant.

  For all three options, dynamic quantities like power, frequency etc. are always set according to the IC panel settings.
- **IC_configuration** : When using IC data from `IC_machine_descriptions=from_HCD_database` , then this parameter allow you to select different configurations: either you use the `default` or a `selected` configuration. In the latter case the name of the configuration is specified in **IC_configuration_name** .
- **IC_configuration_name** : When `IC_machine_descriptions=from_HCD_database` and `IC_configuration=selected` , then this parameter allow you to specify the name of your IC configuration. The name is provided as a string and has to be one of the configurations in the list of IC configurations (9.6.1.3.41) (for details see IMP5 IC-Antennas Database (9.6.1.3.42)). Note that the configuration is tied to the machine you are simulating, e.g. only ITER configurations can be used when simulating the ITER tokamak.
- **IC_power_in** : power (W)
- **IC_frequency_in** : frequency (Hz)
- **IC_phase_in** : phase of the current in each antenna strap (rad). Vector over all straps. E.g. a dipole phasing for a four strap antenna (JET-A2/ITER) may written as `{0,PI,0,PI}` , while a current drive phasing would be written as `{0,PI/2,PI,3*PI/2}` or `{0,-PI/2,-PI,-3*PI/2}` .

9.6.1.3.40 Common IC settings

Machine	IC_power_in	IC_frequency_in	IC_phase_in
ITER	20 MW	54 MHz (central He3 minority at 5.3T)	{ 0 , PI , 0 , PI }
JET	7 MW	33 MHz (central H minority at 2.16T) 37 MHz (central H minority at 2.42T) 42 MHz (central H minority at 2.75T) 47 MHz (central H minority at 3.08T) 51 MHz (central H minority at 3.34T) 33 MHz (central He3 minority at 3.24T) 37 MHz (central He3 minority at 3.63T) 51 MHz (central 2nd harmonic H at 1.67T) 47 MHz (central 2nd harmonic H at 1.54T) 42 MHz (central 2nd harmonic H at 1.38T) 37 MHz (central 2nd harmonic H at 1.21T) 33 MHz (central 2nd harmonic H at 1.08T)	{ 0 , PI , 0 , PI } (dipole) { 0 , PI/2 , PI , 3*PI/2 } (co-current) { 0 , -PI/2 , -PI , -3*PI/2 } (counter-current)
AUG	7 MW	30.0 MHz (central H minority at 2.0 T) 36.5 MHz (central H minority at 2.5 T)	{ 0 , PI }
Tore Supra	9 MW	57 MHz (central H minority at 3.7 T) 63 MHz (central 2nd harmonic H at 2.1 T) 42 MHz (central 3He minority at 3.7 T) 48 MHz (FWEH at 2.1 T)	{ 0 , PI }
WEST (unofficial 2013-08-08)	- MW	55/57 MHz (central H minority at 3.7 T)	

9.6.1.3.41 IC configurations available in the HCD-database

Names of available IC configuration in the machine description database:

Machine	Configuration name	Description
ITER	IC20130809rough	A rough unofficial antenna generated to mimic graphical illustrations.
JET	IC20130809rough	A rough unofficial antenna generated to mimic graphical illustrations.
AUG	IC20130809rough	A rough unofficial antenna generated from a limited number of parameter provided by Roberto Bilato.
WEST	FluxAligned	A rough unofficial antenna. The antenna shape is simply aligned to the flux surface, which is the same antenna that Remi Dumont has been using in his initial studies of ICRF in WEST (2013-10-16).

For detailed descriptions of these antennas see the IMP5 IC-Antennas Database (9.6.1.3.42)

9.6.1.3.42 IC Antenna Database

UNDER CONSTRUCTION

This documentation is generated from the XML schema, the xsd-file, for the code parameters.

9.6.1.3.43 AUG antennas

9.6.1.3.44 AUG configuration: IC20130809rough

Antenna name: AUG/IC20130809rough/A

- frequency = 36500000.0

9.6.1.3.51 The Wall settings panel

The Wall settings panel is the list of variables following the line
`===== WALL SETTINGS =====`
Here is a description of the variables in this panel.

- **WALL_use_panel_settings:** If `TRUE` : use the Wall settings panel to configure the wall properties. If `FALSE` : ignore the Wall settings panel and use the input CPO.
- **WALL_machine_descriptions** : Select from where the Wall description should be taken:

  1. `from_input_CPO` : use the WALL CPO provided by the UAL
  2. `from_HCD_database` : use the a HCD-database entry for the tokamak being simulated (see list of available database entries (9.6.1.3.52)).
  3. `from_codeparameters` : Under development.

9.6.1.3.52 WALL configurations available in the HCD-database

Machine	Configuration name	Description
ITER	default	from the EDRG machine description database (2013)
JET	default	from the EDRG machine description database (2013)
AUG	default	from the EDRG machine description database (2013)
FTU	default	from the EDRG machine description database (2013)

9.6.2 IMP5HCD - the IMP5 Composite Actor for Heating and Current Drive

Purpose	Contact persons	Input	Output
Kepler-actor (29) for integrated modelling of Heating and Current Drive (EC,LH,IC,NBI,alphas-heating)	Thomas Johnson Lorenzo Figini	EU-ITM Plasma bundle (12.3.6) Required CPOs are: `antennas, nbi, wall, equilibrium, coreprof, coreimpur .` Manual setting (Kepler variables) selecting codes, synergy options, and certain modelling parameters.	Subset of the EU-ITM Plasma bundle (12.3.6)containing the CPOs: `waves, distsource, distribution, coresource`

The IMP5 Composite Actor for Heating and Current Drive is a multi layered composite actor. Each layer separates one different groups of models or codes, e.g.

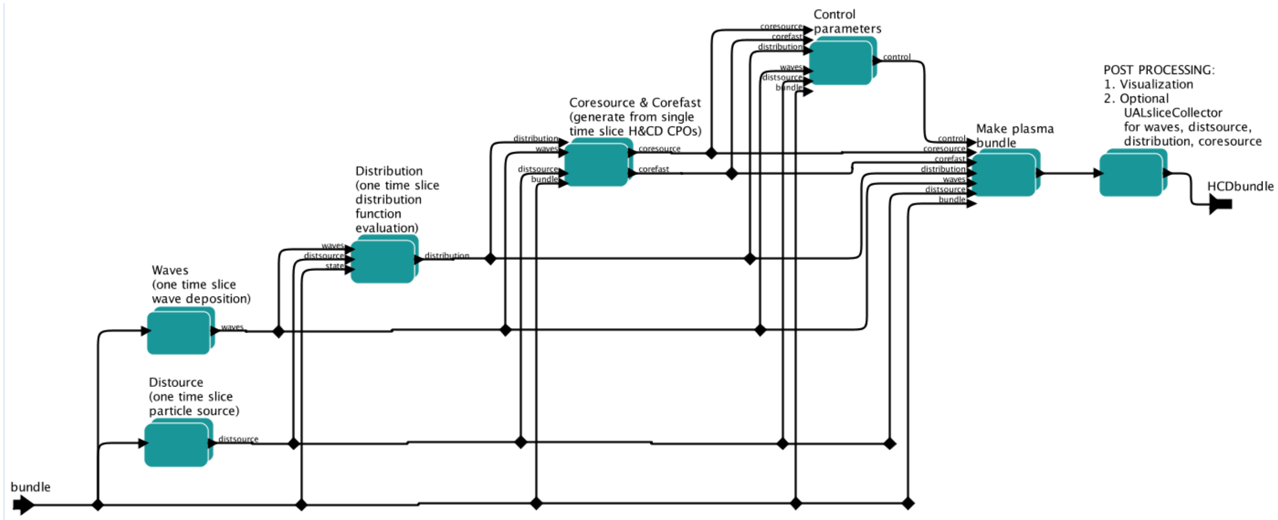
- the generation of CPOs (wave, distsource, distribution and coresource),
- the different heating schemes,
- ions and electrons solvers,
- ...all the way down to the level of Actors for physics models.

The composite actor takes as input the standardized EU-ITM Plasma bundle (12.3.6) and generates as output the CPOs `waves ,distsource ,distribution` and `coresouce` (bundled into a subset of the EU-ITM Plasma bundle).

The IMP5 Composite Actor for Heating and Current Drive is stored as part of the IMP5HCD-SA (9.6.1) workflow.

The IMP5HCD include a number physics codes. For a schort description of these codes and contact information, follow this link [724].

As an example we have below illustrations of some of the structure inside the composite actors for waves (9.6.2.4) and the composite actor for distribution (9.6.2.5).



9.6.2.1 Physics actors in IMP5HCD

Here follows a list of the heating and current drive actor released in the imp5hcd composite actor that have passed at least some elementary robustness tests and in most cases some form of verification. This list is likely to change within a few month time. For the latest details contact Thomas Johnson.

Date of last update: 2014-12-19

[724] `https://www.efda-itm.eu/ITM/html/.html#imp5_workflow__physics_actors`

Code name	Code Category	Contact persons	Short description
gray (9.4.1.1)	EC/waves	Lorenzo Figini	GRAY is a quasi-optical ray-tracing code for electron cyclotron heating & current drive calculations in tokamaks. Documentation of code parameters [725].
travis (9.4.1.1)	EC/waves	Nikolai Marushchenko	Travis is a ray-tracing code for electron cyclotron heating & current drive calculations in tokamaks.
Torray-FOM (9.4.1.1)	EC/waves	Egbert Westerhof	Torray-FOM is a ray-tracing code for electron cyclotron heating & current drive calculations in tokamaks.
bbnbi (9.4.2.3)	NBI/source	Otto Asunta	Calculate the deposition rates of neutrals beam particles, i.e. the input source for Fokker-Planck solvers (not the heating and current drive). Note that the number of markers generated by BBNBI is described by the kepler variable `number_nbi_markers_in` .
nemo (9.4.2.3)	NBI/source	Mireille Schneider	Calculate the deposition rates of neutrals beam particles, i.e. the input source for Fokker-Planck solvers (not the heating and current drive).
nuclearsim (9.4.2.4)	nuclear/source	Thomas Johnson	Simple code for nuclear sources from thermal/thermal reactions. Documentation of code parameters [726]
nbisim (9.4.2.5)	NBI+nuclear/Fokker-Planck	Thomas Johnson	Simple Fokker-Planck code calculating the collisional ion and electron heating from a particle source, either NBI or nuclear.
risk (9.4.2.5)	NBI Fokker-Planck	Mireille Schneider	Bounce averaged steady-state Fokker-Planck solver calculating the collisional ion and electron heating from a particle source and the NBI current drive.
spot (9.4.2.6)	NBI and ICRF Fokker-Planck	Mireille Schneider	Monte Carlo solver for the Fokker-Planck equation. Traces guiding centre orbits in a steady state magnetic equilibrium under the influence of Coloumb collisions and interactions with ICRF waves (through the RFOF library). The can also be used for NBI and alpha particle modelling as it can handle source terms from the distsource CPO.
ascot4serial (9.4.2.6)	NBI, alphas, ICRF / Fokker-Planck	Otto Asunta/Seppo Sipila	Monte Carlo Fokker-Planck solver calculating the collisional ion and electron heating from a particle source and the NBI current drive.
ascot4parallel (9.4.2.6)	NBI, alphas, ICRF / Fokker-Planck	Otto Asunta/Seppo Sipila	Monte Carlo Fokker-Planck solver calculating the collisional ion and electron heating from a particle source and the NBI current drive.
iccoup (9.4.2.1)	IC/coupling	Thomas Johnson	Simple model for the coupling waves from ion cyclotron antennas to the plasma.
LION	IC / waves	Olivier Sauter and Laurent Villard	Global ICRF wave solver
Cyrano	IC / waves	Ernesto Lerche and Dirk Van Eester	Global ICRF wave solver
Eve	IC / waves	Remi Dumont	Global ICRF wave solver
StixReDist	IC / waves	Dirk Van Eester and Ernesto Lerche	1d Fokker-Planck solver for ICRF heating.
ICDEP	IC / waves	Thomas Johnson	Generates Waves-cpo with an IC wave field with Gaussian deposition profiles described by a combination of antenna-cpo input and through code parameters input (see documentation of code parameters [727])

9.6.2.2 Non-physics actors in IMP5HCD

UNDER DEVELOPMENTS

Code name	Code Category	Contact persons	Short description
addECant	Antennas / generator	Thomas Johnson/Lorenzo Figini	Appends EC setting to an Antennas-cpo. The settings are provided as a combination of Kepler-input (for power and launching angles) and machine parameters that are hard-coded for each tokamak. In case the EC system of a tokamak is not implemented it uses the code-parameters from the writeECant actor (see documentation of code parameters [728])
addICant	Antennas / generator	Thomas Johnson	Appends IC setting to an Antennas-cpo. The settings are provided as a combination of Kepler-input, including the power, frequency and phasing. In case the IC machine parameters are not available in the input CPO, then these are filled with hardcoded parameters for a given tokamak.
nbifiller	NBI / generator	Thomas Johnson	Updates the time dependent NBI setting to an NBI-cpo. The settings are provided as a combination of Kepler-input, including the mass, charge, power, injection energy and the beam-power-fractions. In case the IC machine parameters are not available in the input CPO, then these are filled with hardcoded parameters for a given tokamak.
hcd2coresource	coresource-CPO / data-joiner	Thomas Johnson	Generates a Coresource-cpo from input Distsource, Waves and Distribution cpos.
waves2source	coresource-CPO / data-joiner	Lorenzo Figini	Generates a Coresource-cpo from input Waves cpo.

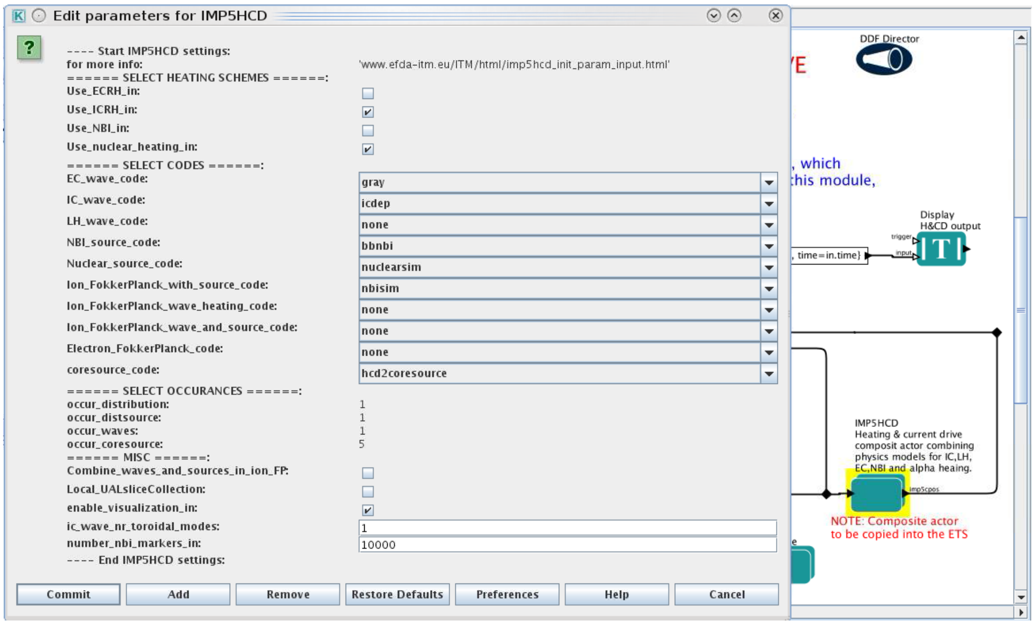
Code name	Code Category	Contact persons	Short description
hcd2corefast	coresource-CPO / data-joiner	Thomas Johnson	Generates a Corefast-cpo from the input Distribution cpo.
emptywaves	waves-CPO / generator	Thomas Johnson	Generates an empty Waves cpo.
emptydistsource	distsource-CPO / generator	Thomas Johnson	Generates an empty Distsource cpo.
emptydistribution	distribution-CPO / generator	Thomas Johnson	Generates an empty Distribution cpo.
emptycoresource	coresource-CPO / generator	Thomas Johnson	Generates an empty Coresource cpo.
emptycorefast	corefast-CPO / generator	Thomas Johnson	Generates an empty Corefast cpo.
merge4waves	waves-CPO / merger	Thomas Johnson	Mergers two Waves cpos.
merge4distsource	distsource-CPO / merger	Thomas Johnson	Mergers two Distsource cpos.
merge4distribution	distribution-CPO / merger	Thomas Johnson	Mergers two Distribution cpos.

9.6.2.3 Parameter input to IMP5HCD

UNDER CONSTRUCTION

Running IMP5HCD there are a number of workflow setting to consider.



9.6.2.3.1 Select Heating Schemes

These setting allow the user to turn on or off heating schemes.

9.6.2.3.2 Select Codes

Here the physics codes of different categories can be selected. More information about the codes one can choose from can be found here (9.4).

NOTE: Some codes that appear in the drop down menues may not yet be running with the latest version of the UAL, thus check the list of physics actors available in IMP5HCD (9.6.2.1).

NOTE: The codes selected here are only run if the corresponding heating scheme is selected in Select Heating Schemes (9.6.2.3.1). What codes are used also depends on setting in Misc (9.6.2.3.2), e.g. the variable `Combine_waves_and_sources_in_ion_FP` will switch between running the different ion Fokker-Planck codes:

- when Combine_waves_and_sources_in_ion_FP=TRUE , then the Fokker-Planck solver is selected from Ion_FokkerPlanc

- when Combine_waves_and_sources_in_ion_FP=FALSE , then the Fokker-Planck solver is selected from Ion_FokkerPlanck_with_source_code and Ion_FokkerPlanck_wave_heating_code .

9.6.2.3.3 Select Occurrences

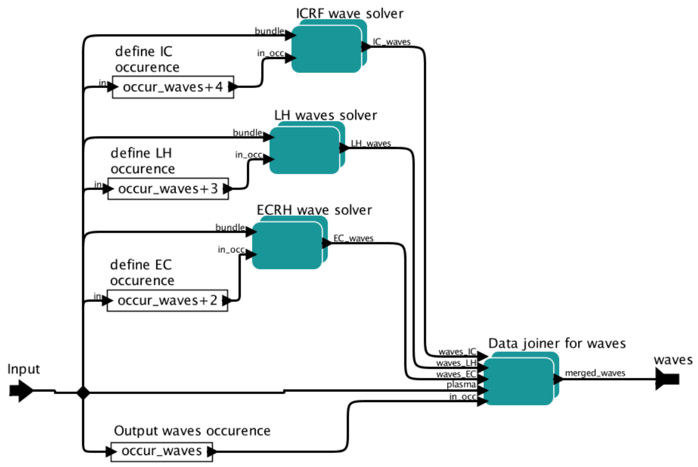
Selecting the first in s series of occurrence numbers. For advanced users only.

9.6.2.3.4 Misc

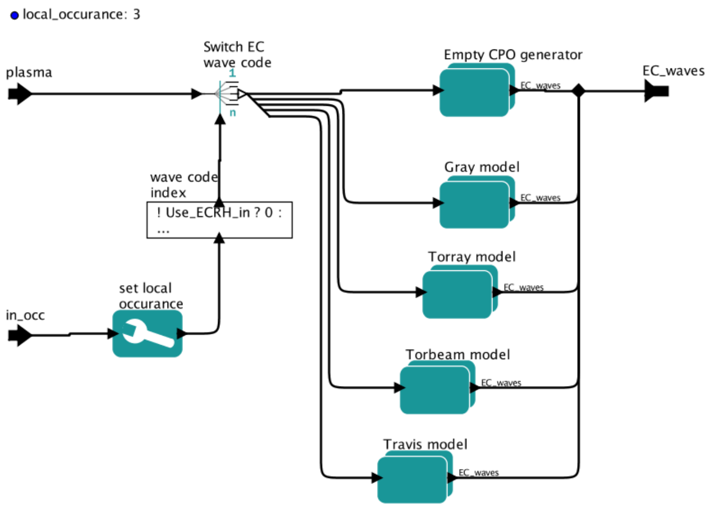
- **Combine_waves_and_sources_in_ion_FP** : Switch between using a single code for solving the ion Fokker-Planck equation including both wave and source heating, or to have two different solver calculating the heating from the wave and source terms.
- **Local_UALsliceCollection** : Enable UAL slice collection. Note that this parameter has to be switched off when running in the ETS.
- **enable_visualization** : Enable visualization. Note that this parameter has to be switched off in the ETS.
- **ic_wave_nr_toroidal_modes** : the number of toroidal Fourier modes to be used in the ICRF wave field.
- **number_nbi_markers_in** : the number of nbi markers to be used in Monte Carlo NBI solvers.

9.6.2.4 Composite Actor for Waves

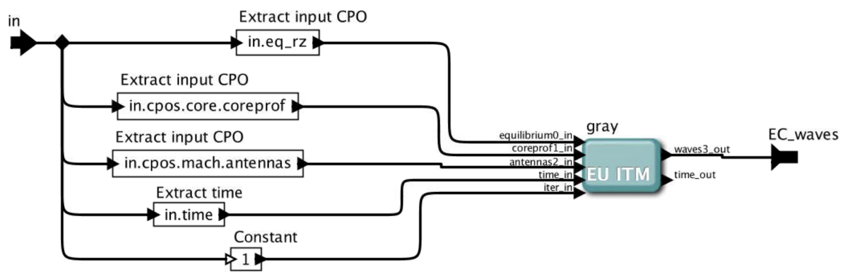
Wave field solvers in the IMP5 Composite Actor for Heating and Current Drive are collected in a composite actor, which in turns separates the different heating schemes ICRF, LH and ECRH. The three waves fields are then joined by a datajoiner for the waves CPO.



As an example we here show how the ECRH composite actor select the physics code to use from a long list. The variable that determines the selection is a global parameter ec_wave_code , set at the top-level of the composite actor IMP5HCD. Note that if you run IMP5HCD in the ETS ec_wave_code is set on a higher level.

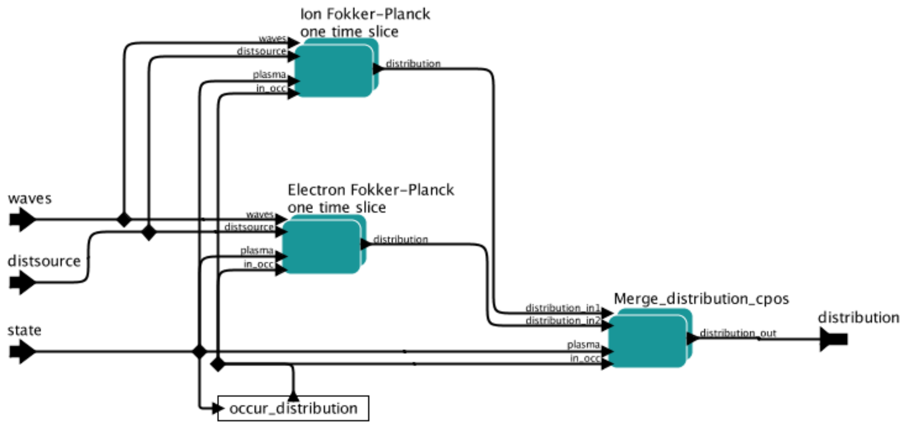


When selecting `ec_wave_code=gray` the workflow will entre the `Gray model` composite actor containing the Gray code (9.4.1.1), a ray tracer for EC waves.

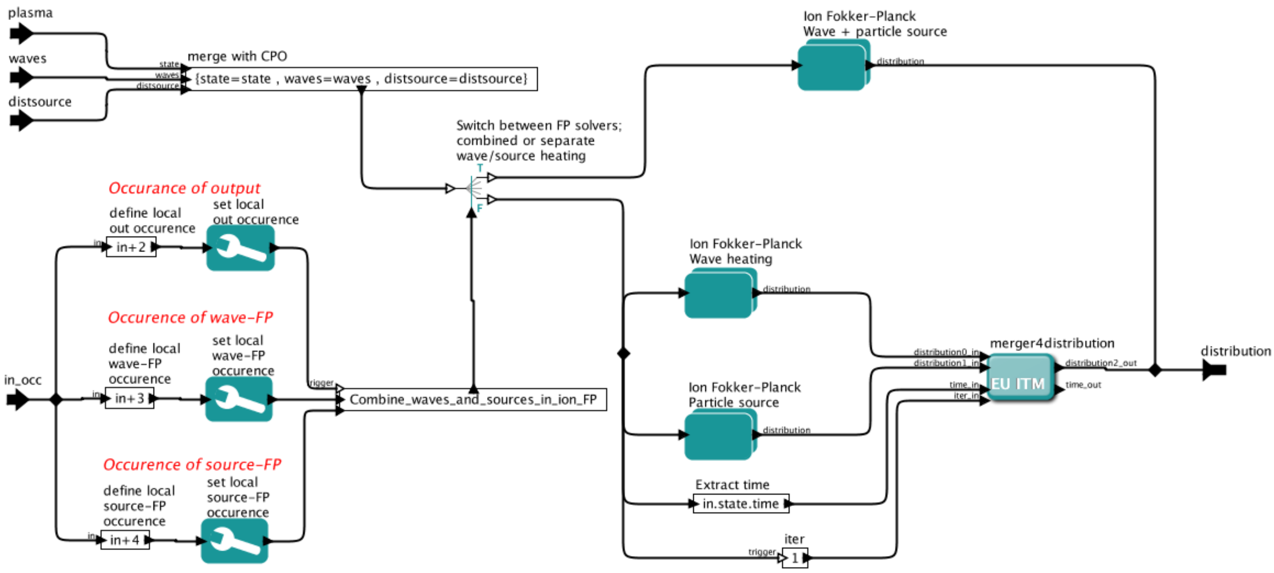


9.6.2.5 Composite Actor for Fokker-Planck

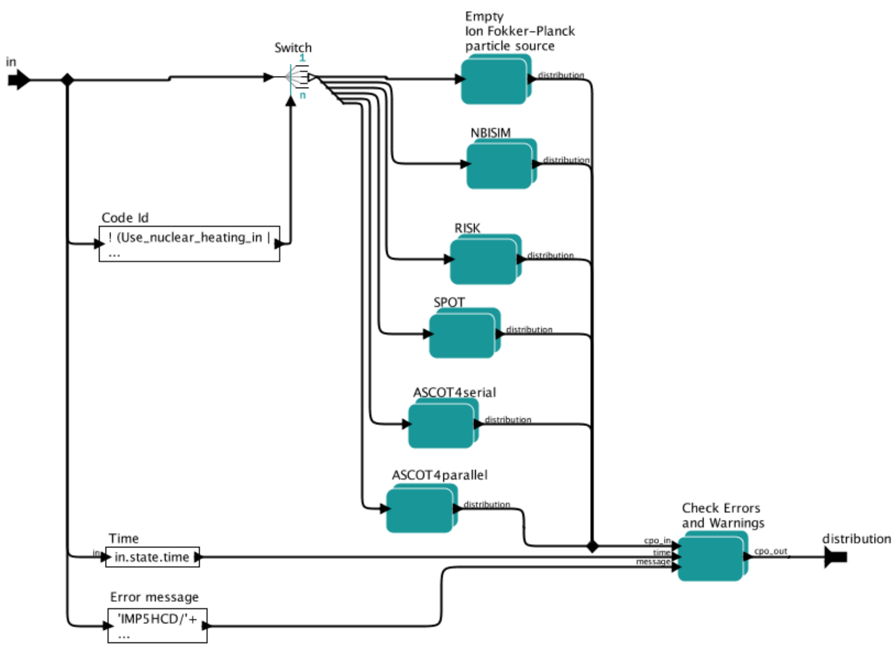
The composite actor for Fokker-Planck solvers are separated into solver for the electron and ion distribution function



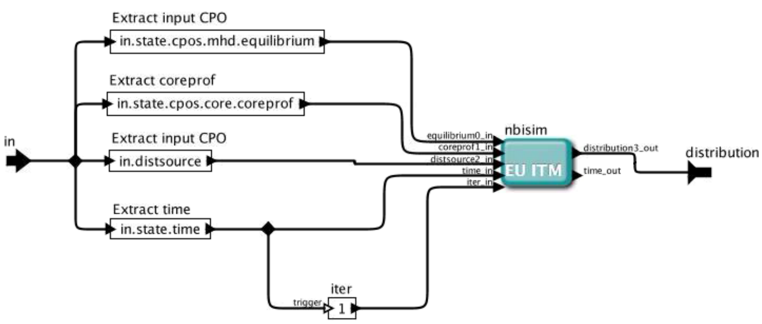
As an example is shown below the composite actor for the ion-Fokker Planck solvers. This solvers allows two different ways of operation, either the full Fokker-Planck equation is solved including both wave field acceleration and particle source terms (the box "Ion Fokker-Planck wave + particle source" in the figure), or alternatively the two effects (wave acceleration and particle source terms) are treated seperately in two different solver (...in the figure).



Next looking more carefully what's inside e.g. the "Ion Fokker-Planck particle source" box we find again both an Empty CPO Generator and a long list physics codes to choose between: `nbisim`, `risk`, `spot`, `ascot4serial`, `ascot4parallel` .



Finally, inside the NBISIM composite actor you find the nbisim actor.



9.6.2.6 CPOs-fields required for the IMP5HCD composite actor

An Actor running under IMP5HCD (9.6.2) have to fill in certain fields, or else the workflow will not work properly. Here follows a list of requirements in 4.08b, using Fortran notation; for C, Java, or matlab notation replace "%" by "." (a dot).

- `waves(.)%coherentwave(.)%grid_1d%rho_tor` (7.9.3.1.343)
  is required by imp5coresource (??). If this field is not filled, then the data in `waves(.)%coherentwave(.)` (7.9.3.1.77) will be discarded in the coresource output.

WARNING: This list is outdated. There are now a large number of reuqired fields that will be added to this list.

9.6.2.7 Error handling

When building advanced workflows like the IMP5HCD it is imparative that the individual components are robust and behaves in a controlled manner, even when the input is outside the conditions for validity. For this reason the ITM strongly encourage defensive programming (13.13).

The output of any ITM actor should in addition always provide error messages the output CPOs. Every CPO therefore includes a derived datatype called codeparam (located directly under the root of every CPO), which contains the field output_flag in which the error flag should be stored, see above.

< *any-cpo* >`%codeparam%output_flag` (7.9.3.1.343)	Integer output flag: 0 means the run was successful and can be used in the rest of the workflow, <0 means failure

last update: 2015-07-10 by tjohnson

9.6.3 IMP5 contributions to ETS

The IMP5 codes have been included in the ETS using the IMP5HCD [729] composite actor. In addition a composite actor for generating an initial state of the IMP5 cpos, including the input cpos Antennas and NBI has been provided.

9.6.3.1 Import a new version of IMP5HCD into the ETS

Importing the IMP5HCD into the ETS is still not done automatically. Here follows a description for how to import a new version of the IMP5HCD into the ETS.

9.6.3.1.1 Export IMP5HCD composite actors

The first step is to extract composite actors from the IMP5HCD_SA. To do this, go to the directory `imp5hcd/` and run the command:

```
make composite_actors
```

This will add the composite actors `IMP5HCD` , `IMP5HCD_CORE` and `initial_IMP5_state` as actors in your kepler folder.

9.6.3.1.2 Transfer IMP5HCD settings

First, note that these setting only need to be transferred when the setting parameters used in the IMP5HCD has been changed. Also, the setting cannot be transferred in the Kepler-gui. Instead this can be done directly in the xml using a text editor.

First step here is to copy the setting from the file `imp5hcd_sa.xml` . To copy the settings copy all text starting from the element named

[729] https://www.efda-itm.eu/ITM/html/.html#imp5_compositeactor_imp5hcd

```
---- Start IMP5HCD settings
```

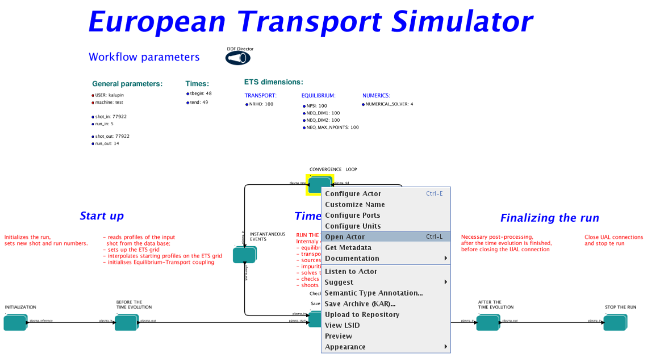
and ending with the element

```
---- End IMP5HCD settings
```

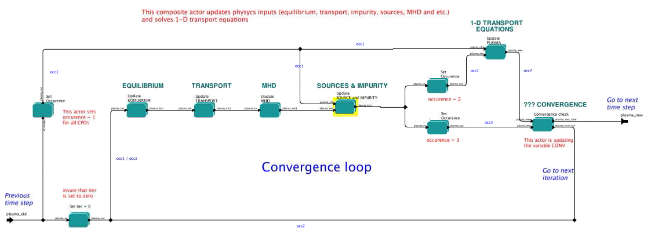
Then replace the corresponding section in the file ETS_WORKFLOW.xml .

9.6.3.1.3 Import IMP5HCD_CORE composite actors

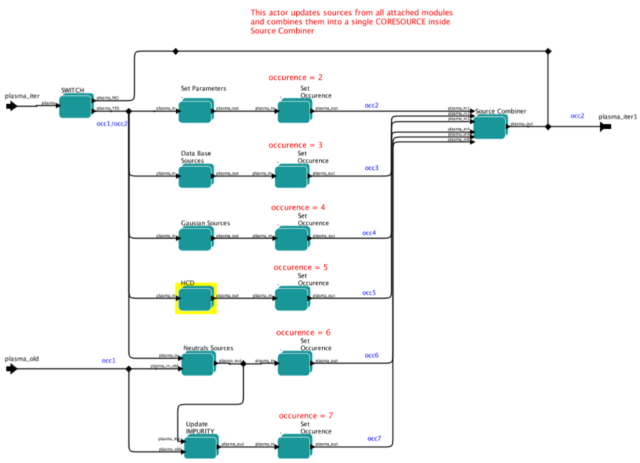
Next, download the ETS workflow, import the ETS actors and open the workflow (here are detailed instructions for each of these steps [730]) . Inside the ETS we find the IMP5HCD by first opening up the "Convergence Loop"



Here we may edit the IMP5HCD settings by double clicking on the actor "Update SOURCE and IMPURITY". Next, open "Update SOURCE and IMPURITY"

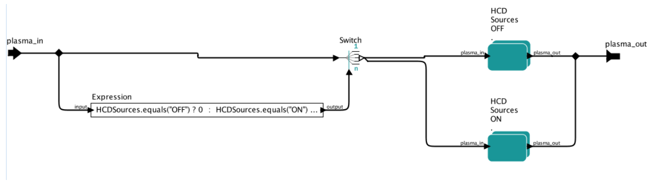


Open the "HCD"

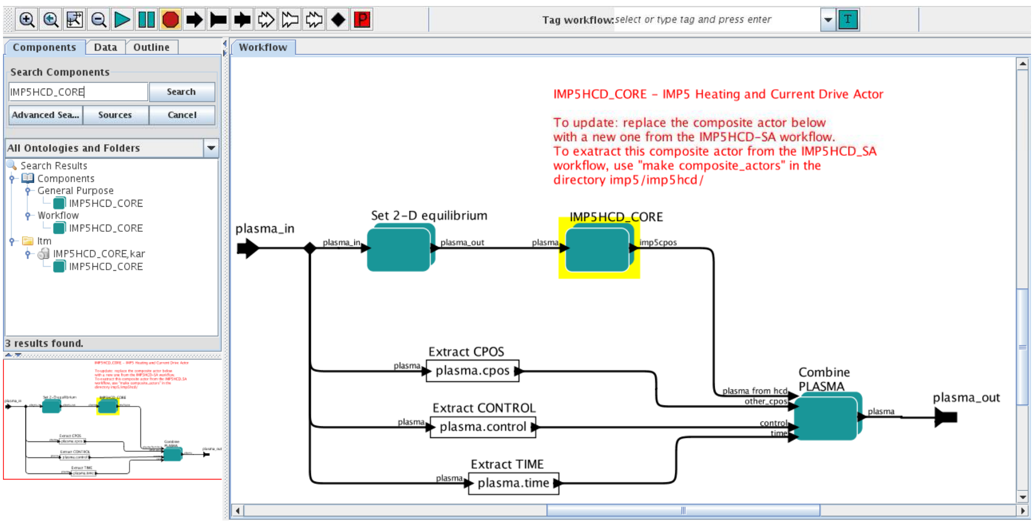


Open the "HCD Sources ON"

[730] https://www.efda-itm.eu/ITM/html/.html#ETS_A_KEPLER

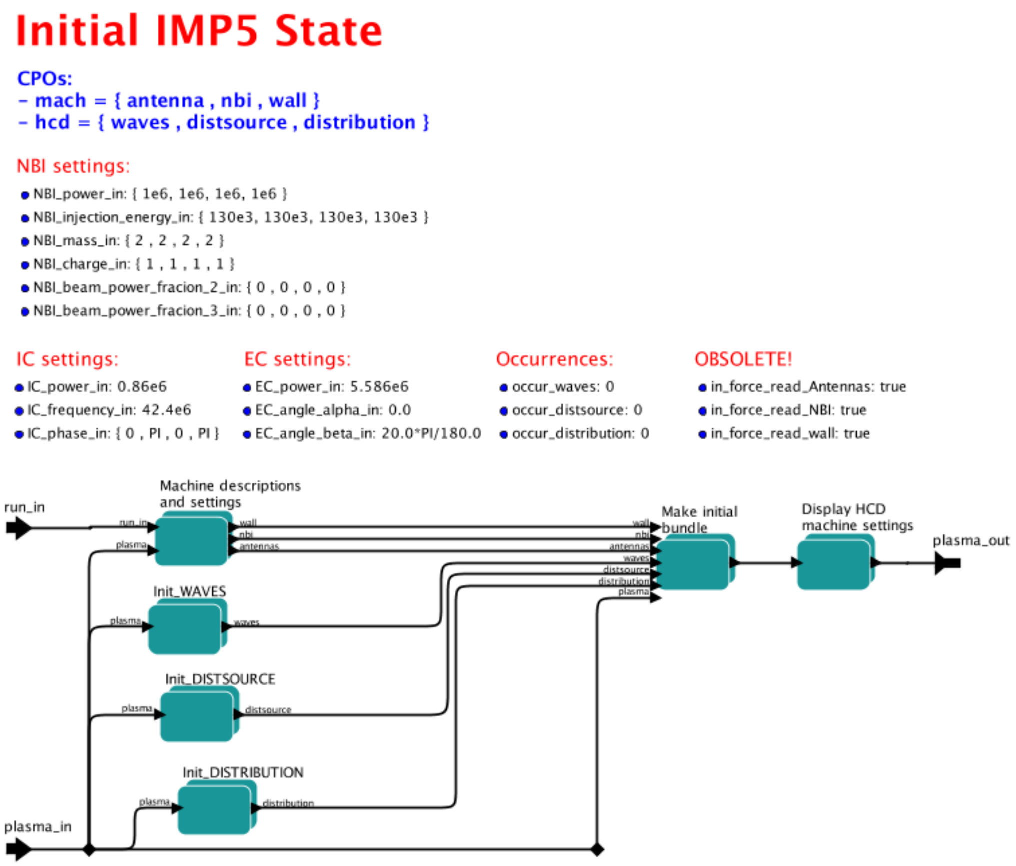


We are now at the place where the "IMP5HCD_CORE" should be imported. First, identify the old version of IMP5HCD Actor, marked in yellow in the figure below. Then search for the "IMP5HCD_CORE" among *Components/Search Components* , as shown in the figure below. Drag the "IMP5HCD_CORE" into the workflow to replace the old version.

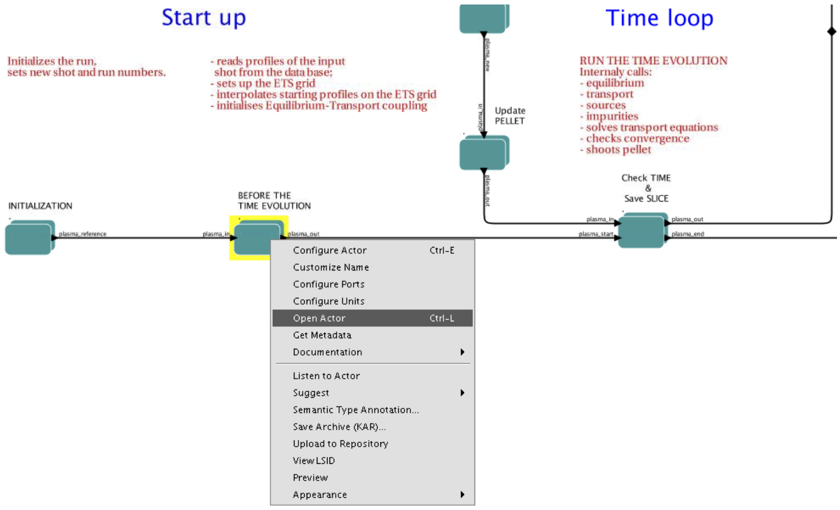


9.6.3.2 Import a new version of "initial_imp5_state" into the ETS

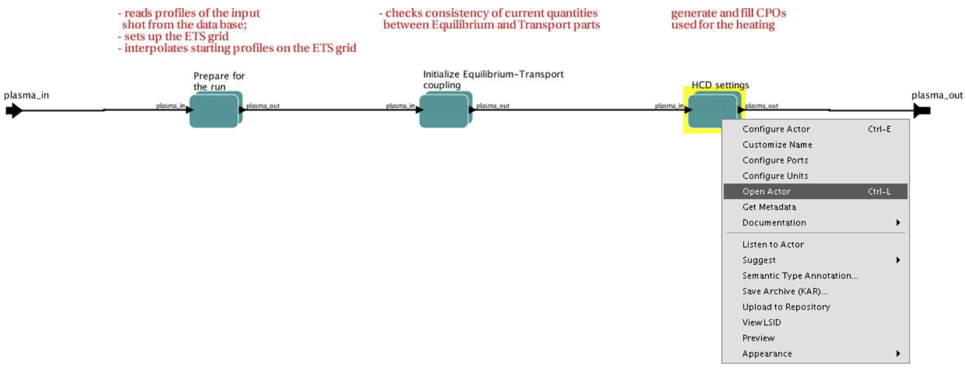
Here follows a description for how to import a new version of the composite actor "initial_imp5_state" into the ETS.



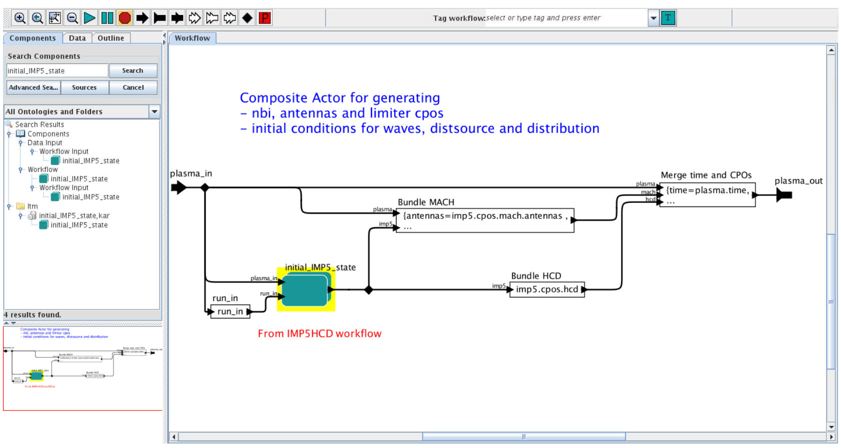
The first step to import the "initial_IMP5_state" is to extract the composite actor, as described here (9.6.3.1.1). Next open the workflow `ETS_WORKFLOW.xml` In the ETS_WORKFLOW_V2.1.xml workflow, open the Actor "BEFORE THE TIME EVOLUTION"



Next, open the Actor "HCD settings"



We're now at the place where the new "initial_imp5_state" Actor should be imported. First, identify the old version of the Actor, marked in yellow in the figure below. Then search for the "initial_imp5_state" among *Components/Search Components* , as shown in the figure below. Drag the "initial_imp5_state" into the workflow to replace the old version.



9.6.3.3 Proceedure for providing a physics module to the IMP5HCD and the ETS

The following is a proceedure for coupling an actor (physics module) to the ETS:

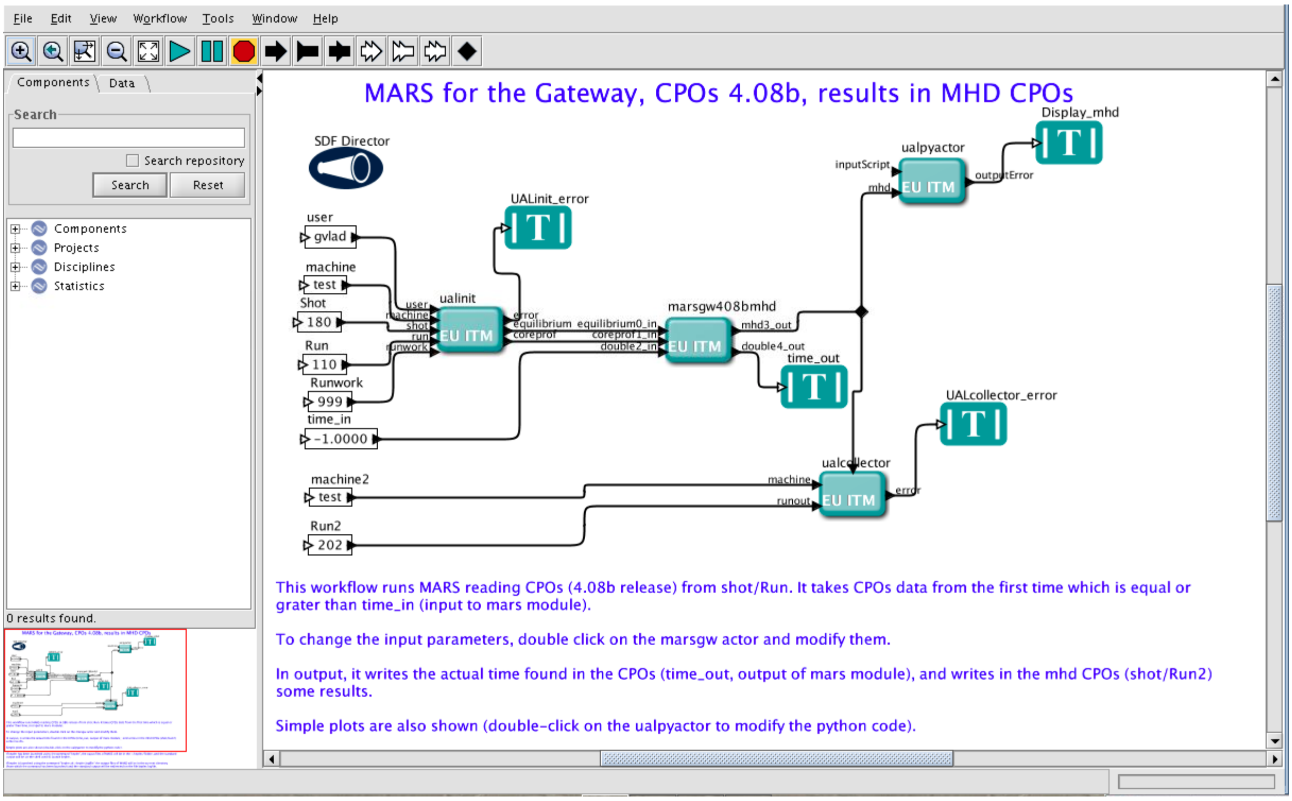
1. Build an single-code-workflow for testing your actor. This workflow may include only UALinit, the actor with "your physics module" and the UAL collector; all coupled serially. One such example is the Mars workflow (9.6.4), which include also advanced features like a phytons visualisation actor.

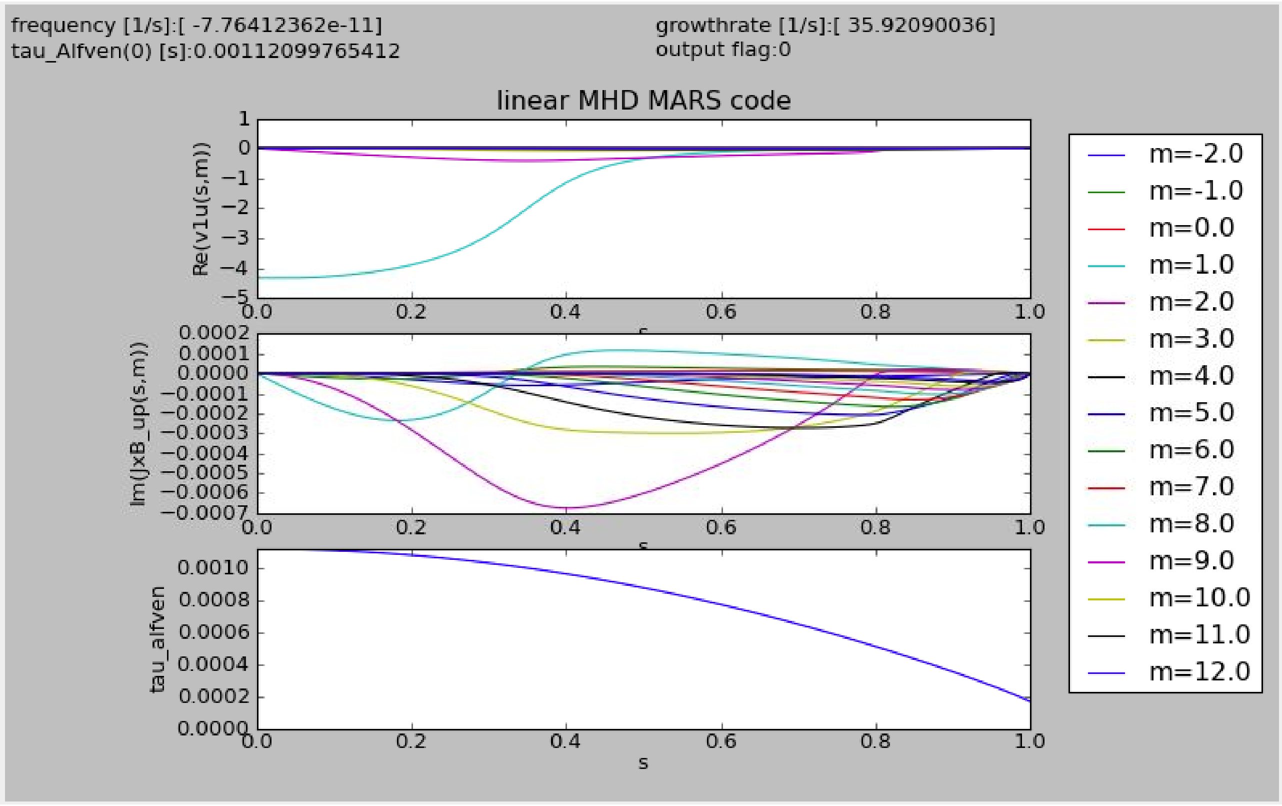
2. Verify that your actor reproduces results obtained in previous non-Kepler based version of your code
3. Download the IMP5HCD-SA workflow (see Accessing the IMP5HCD-SA workflow (9.6.1.2))
4. Import your actor into the IMP5HCD
5. Verify that you get the same result that you got in your single-code-workflow
6. Download the ETS workflow
7. Import your version of the IMP5HCD into the ETS workflow (see Import IMP5HCD into the ETS (9.6.3.1))
8. Verify that your code give the correct result in the ETS
9. Verify that your is correctly captured in the coresource CPO generated by the workflow

9.6.4 Workflow for MARS (MHD module of HYMAGYC)

This workflow reads equilibrium and coreprof CPOs and solves the linear MHD stability equations; some ouputs (mhd CPOs is still in a preliminary version) are stored in mhd CPOs and then plotted using a python actor (see figure below, which refers to a n=1 internal kink in a JET-like equilibrium).

Type	Actors	Input CPOs	Output CPOs
linear MHD module for HYMAGYC	ualinit marsgw408b ualpyactor ualcollector	equilibrium coreprof	mhd

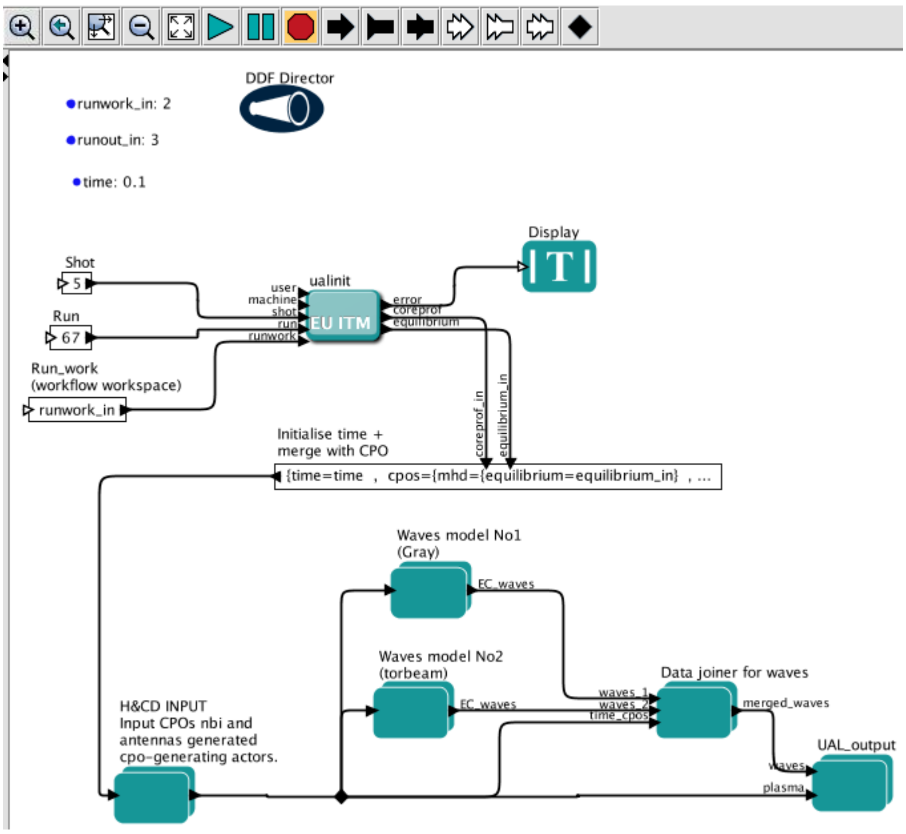




9.6.5 Workflow for code-code Benchmarking

NOTE: this workflow was developed for 4.08b.

The IMP5 has developed a workflow for benchmarking wave codes generating the `waves` as output. The default version runs the two EC wave code GRAY and TORBEAM as shown below. The wprlflow runs the two codes in parallel and then merges the `waves` output from the two codes into a single `waves` CPO. Thus, the data from the two codes appear as `waves(1)%coherentwave(1)` and `waves(1)%coherentwave(2)` .



Contact persons: Thomas Johnson (4831) (skype: tjohn74)

The waves_benchmark workflow can be found in the GFORGE (29) repository KeplerWorkflows [731]. For checking out a local copy of the 4.08b version of the workflow:

```
svn co https://gforge6.eufus.eu/svn/keplerworkflows/trunk/4.08b/imp5/benchmark/
```

For more information, see the file README_waves_benchmark (stored in the repository).

9.7 IMP5 Shots

Below are lists of shots available in the imp5-shot database; found in the public directory of the user wwwimp5.

```
~wwwimp5/public/itmdb/itm_trees/<machine>/<UAL>/mdsplus/0/
```

where <machine> is the name of the machine, e.g. "test", "jet", or "asdex" and <UAL> is the version number of the UAL, e.g. "4.09a" or "4.10a".

9.7.1 UAL Version 4.09a

The shots can be accessed by setting

```
UAL = 4.09a
```

9.7.1.1 Machine: TEST

The shots can be accessed by setting

```
TOKAMAKNAME = test
```

The following table lists the shot by shot number and run number together with the list of stored CPOs (29) , the user name of the database, and a short description.

Shot	Run	CPOs	user	generated with	description
5	67	equilibrium coreprof	Coster	ETS fortran workflow (with equilibrium from the eqaugmenter)	ITER sized test plasma.
	1067	equilibrium coreprof antennas waves	Figini / Coster	Gray processing of machine=test/shot=5/run=67 from ETS fortran workflow (with equilibrium from the eqaugmenter)	ITER sized test plasma.

9.7.1.2 Machine: ASDEX

The shots can be accessed by setting

```
TOKAMAKNAME = aug
```

The following table lists the shot by shot number and run number together with the list of stored CPOs (29) , the user name of the database, and a short description.

[731] https://gforge6.eufus.eu/project/keplerworkflows/

Shot	Run	CPOs	user	generated with	description
20116	502	equilibrium coreprof	Coster	ETS fortran workflow (with equilibrium from the eqaugmenter)	ASDEX plasma (possibly shot 20116, run 2 documented in the IMP12 page, reprocessed using the ETS).

9.7.1.3 Machine: JET

The shots can be accessed by setting

```
TOKAMAKNAME = jet
```

The following table lists the shot by shot number and run number together with the list of stored CPOs (29) , the user name of the data base, and a short description.

Shot	Run	CPOs	user	generated with	description
10	6	equilibrium coreprof...	huynh?		JET shot 77922 using nclass, bgb, equilibre chease, and transport solver equation in te, ti et psi. The shot starts from 48.488s to 57.2283s. Default input to the CEA-ETS workflow.
77922	1	equilibrium coreprof...	kalupin?		JET shot 77922. Taken from the imp3/ets repository 22 November 2011. Default input to the IPP/IST-ETS workflow.
71827	1	equilibrium coreprof...	kalupin?		JET shot 71827. Taken from the imp3/ets repository 22 November 2011.

9.7.2 UAL Version 4.10a

The shots can be accessed by setting

```
UAL = 4.10a
```

9.7.2.1 Machine: TEST

The shots can be accessed by setting

```
TOKAMAKNAME = test
```

The following table lists the shot by shot number and run number together with the list of stored CPOs (29) , the user name of the data base, and a short description.

Shot	Run	CPOs	user	generated with	description
5	67	equilibrium coreprof	Coster	ETS fortran workflow (with equilibrium from the eqaugmenter)	ITER sized test plasma.
	68	equilibrium coreprof	Coster	ETS fortran workflow (with equilibrium from the eqaugmenter)	ITER sized test plasma.
77299	12	equilibrium coreprof ??	Kalupin	ETS-A workflow	Unknown.

9.8.4 2011 Code Camp in Innsbruck, 28 November-11 December

The participation of the IMP5 in the Innsbruck Code Camp was discussed at the General Meeting in Garching. The preliminary plan is that the IMP5 will participate both weeks of the Code Camp.

- **Week 1:** Focus on integration with the aim of having as many as possible present to reach a critical mass of modellers so that we can help each other.
- **Week 2:** Focus on integration into the ETS. Also integration will take place, but there will be fewer people there to ask for help.

9.9 IMP5 Benchmarking

9.9.1 Report from the 2014 benchmarking activities

- Report on IC benchmarking in 2014 [787]
- Report on EC benchmarking in 2014 [788]
- Report on NBI benchmarking in 2014 [789]

9.10 Private IMP5 pages

To access the private IMP5 pages [790], an IMP5 password is needed.

10 ISM

10.1 Scientific Rationale and Main Objectives

Integrated scenario modelling is essential for understanding the physics of magnetically confined fusion plasmas, prediction and optimisation of plasma performance. The main objectives of the ISM group within the ITM TF are to provide support to:
- interpretative and predictive scenario modelling on existing EU tokamaks addressing the physics and operational issues
- scenario modelling activities to cover the preparation of operational scenario for ITER, JT60-SA, DEMO

10.2 ISM activities

ACT1: Support to the validation and physics application of the ETS and ITM tools
ACT2: Interpretative and predictive scenario modelling on existing devices
ACT3: Support to predictive scenario modelling for future devices (e.g. JT60-SA, ITER, DEMO)

10.3 Meetings

10.3.1 2010/09/13-17 ITM General Meeting in Lisbon and ISM Working Session

10.3.1.1 1.Monday

- *Integrated Scenario Modelling, ISM, Workprogramme* (pdf [791]), by X.Litaudon
- *ITER Hybrid Regime: modelling requests* (pdf [792]), by W.Houlberg

787 https://www.efda-itm.eu/ITM/imports/imp5/public/benchmark/2014/

10.3.2.2.2 Reports from working session

- *Current diffusion analysis on JET hybrid shots* (ppt [807]), by J.Garcia
- *New simulations of ITER hybrid scenario* (ppt [808]), by J.Garcia
- *ITER baseline scenario ramp-up simulations with CREATE-NL + JINTRAC. Comparison CoppiTang/Bohm-gyroBohm - preliminary results* (ppt [809]), by F.Koechl

10.3.2.3 3.Wednesday

- *Parameters for EPED simulations* (ppt [810]), by X.Litaudon
- *Integrated ITER scenario modelling and density evolution prospects* (ppt [811]), by S.Wiesen

10.3.2.4 5.Friday

- *Impurity concentration during the current ramp up* (ppt [812]), by P.Belo
- *Predictive modelling of current ramp-down in JET discharges* (pdf [813]), by J.Lonnroth
- *JET current ramp down with METIS code* (ppt [814]), by J.F.Artaud
- *Update on ISM-P2-2010/11-08: ASDEX hybrid modelling* (ppt [815]), by J.Citrin
- *#77922, #77914 Simulations with JETTO and comparison to CRONOS and measurement data* (ppt [816]), by F.Koechl
- *Optimising ITER current ramp up for hybrid scenario* (ppt [817]), by D.Hogeweij
- *Parameter domain exploration with METIS for the ITER hybrid scenario* (ppt [818]), by E.Nardon
- *Report on benchmarking of Coppi-Tang model in ASTRA and CORSICA* (ppt [819]), by I.Voitsekhovitch
- *Very preliminary JT-60SA modelling with METIS code - Scenario #4* (ppt [820]), by X.Litaudon
- *Conclusion working session Culham* (ppt [821]), by X.Litaudon

10.3.3.2 2.Tuesday

10.3.3.2.1 ISM-IO core-SOL integrated modelling meeting

- *Agenda of joint meeting/discussion: integrated core-edge-SOL modelling for ITER: present status & perspectives* (ppt [823]), by I.Voitsekhovitch
- *ITER integrated modelling: Plasma Simulator(s) and Spatial Domain Coupling* (ppt [824]), by W.A.Houlberg
- *On core-SOL Integration in Scenario Modelling for ITER* (pdf [825]), by A.S.Kukushkin
- *Integrated ITER scenario modelling and density evolution prospects* (pdf [826]), by S.Wiesen
- *Fully predictive modelling of L-H and H-L transition* (ppt [827]), by V.Parail
- *ETS* (ppt [828]), by D.Coster

10.3.3.2.2 Reports from working session

- *Simulations of the H to L transition in JET plasmas* (ppt [829]), by P.Belo
- *Current diffusion analysis on JET hybrid shots* (pdf [830]), by J.Garcia

10.3.3.3 3.Wednesday

- *Current diffusion analysis on JET hybrid shots* (pdf [831]), by J.Garcia
- *Draft of ISM talk on T&C ITPA for discussion/completion: ISM modelling activity on current ramp up* (ppt [832]), by I.Voitsekhovitch

10.3.3.4 4.Thursday

- *JT-60SA: operational scenarios and assessment of the plasmas* (ppt [833]), by G.Giruzzi
- *First CRONOS simulation of JT60-SA* (pdf [834]), by M.Schneider
- *LHCD in JT60_SA: a preliminary study* (pdf [835]), by E.Barbato

10.3.3.5 5.Friday

- *Next ISM working session: a word from the LOC* (pptx [836]), by D.Hogeweij
- *Status of edge modelling with EDGE2D for ITER Hybrid Scenaio* (ppt [837]), by D.Harting
- *SOUL1D benchmark using EDGE2D models and JET reference shots* (ppt [838]), by C.Guillemaut

- *H-mode baseline scenario at 2.5 MA* (ppt [877]), by B.Bucalossi
- *L-H power threshold studies: Be/W vs C* (ppt [878]), by G.Calabro
- *Modelling requirements for Ex-2.1.7 'Current profile access and scenario overlap'* (ppt [879]), by J.Mailloux
- *Ex-2.3.1 Hybrid scenario development with the ILW* (ppt [880]), by J.Hobirk
- *Ex 1.1.7/2.2.1/2.2.2 Modelling needs* (pdf [881]), by J.Coenen
- *Ex -2.2.3 Integration of seeding and ELM control techniques* (ppt [882]), by P.Monier-Garbet
- *Ex -1.3.2 Fuelling and Seeding studies: Modelling aims* (ppt [883]), by G.Maddison
- *Ex -2.2.5: Radiating type III ELMy H-mode* (ppt [884]), by A.Huber
- *Edge modelling resources - November 2011* (ppt [885]), by M.Groth

10.3.5.3 3.Wednesday

- *The EPED Pedestal Model: Tests on JET and Predictions for ISM ITER Scenarios* (pdf [886]), by P.Snyder

10.3.5.4 4.Thursday

- *Update on the collaboration project for the analysis of JT60U and JET shots* (pdf [887]), by J.Garcia
- *First Analysis of Integrated Magnetic and Kinetic Control Experiments for AT Scenarios on DIII-D* (pdf [888]), by D.Moreau

10.3.5.5 5.Friday

- *Introduction* (ppt [889]), by X.Litaudon
- *Bootstrap comparison with NCLASS CRONOS/ASTRA* (ppt [890]), by V.Basiuk
- *SANCO - ETS/impurity code benchmarking for Be* (ppt [891]), by I.Ivanova-Stanik
- *Modelling of JET current ramp down discharges with Bohm-gyroBohm model* (doc [892]), by J.Bizarro
- *Update on AUG/JET modelling* (ppt [893]), by J.Citrin
- *L-H and H-L transition* (ppt [894]), by P.Belo
- *LHCD during JET current ramp up* (pdf [895]), by E.Barbato
- *Particle transport in JET and ITER HS* (ppt [896]), by L.Garzotti

last update: 2012-05-16 by coster

10.3.6 ISM Working Session May 21 - 25 2012 Vienna, Austria

10.3.6.1 1.Monday

- *Local information* (ppt [900]), by F.Koechl
- *Agenda* (pdf [901]), by X.Litaudon
- *Introduction* (ppt [902]), by X.Litaudon
- *Modelling of JET Hybrid Scenarios* (pdf [903]), by I.Voitsekhovitch
- *Optimizing the current ramp up phase for the hybrid ITER scenario* (ppt [904]), by G.M.D.Hogeweij
- *Application of the parameterized EPED1 model to time-dependent transport simulation* (pdf [905]), by S.H.Kim

10.3.6.2 5.Friday

- *NCLASS benchmark* (ppt [906]), by V.Basiuk
- *Current diffusion in hybrid scenarios* (ppt [907]), by J.Garcia
- *Density simulation in JET HS* (ppt [908]), by L.Garzotti
- *Modelling of ELM mitigation at JET: study of density depletion at high fELM* (ppt [909]), by F.Koechl
- *ITER hybrid scenario GLF23 modelling with EPED1 pedestal prediction* (ppt [910]), by J.Citrin
- *Free boundary equilibrium transport simulations of ITER scenarios under control* (ppt [911]), by J.Urban
- *Modelling of ITER hybrid scenario: sensitivity analysis with METIS* (ppt [912]), by X.Litaudon
- *ARTAEMIS:Plasma response models and profile control in ITER* (ppt [913]), by F.Liu
- *Implementation of the JT-60SA NBI configuration in EU transport codes* (ppt [914]), by T.Bolzonella
- *Update on the collaboration project for the analysis of JT60U and JET shots* (ppt [915]), by J.Garcia
- *Predictive simulations of JT60-SA* (ppt [916]), by L.Garzotti

10.3.7 ISM Working Session November 19 - 23 2012 JET Culham, UK

10.3.7.1 1.Monday

- *Welcome and local information* (ppt [917]), by I.Voitsekhovitch
- *Agenda* (ppt [918]), by X.Litaudon
- *High priority modeling tasks from IOS-ITPA* (ppt [919]), by G.Sips
- *Pulses for analysis with the ILW* (ppt [920]), by E.Joffrin
- *JINTRAC capabilities for integrated core - edge modelling* (ppt [921]), by M.Romanelli
- *Coupled core-SOL simulations of L-H and H-L transitions in ITER* (ppt [922]), by V.Parail

10.3.7.2 2.Tuesday: Joint ISM and JET TF meeting on scenario modelling

- *Status of the scenario analysis and modelling work for C29 and C30* (ppt [923]), by E.Joffrin
- *Analysis of current diffusion with ILW* (pptx [924]), by J.Garcia
- *The q-profile formation in Hybrid pulses with ILW: modelling and experiment* (ppt [925]), by Yu.Baranov
- *ITER ramp-up and ramp-down* (pptx [926]), by D.Hogeweij
- *JETTO simulations of q profile during ramp up and ramp down* (pptx [927]), by E.Barbato

10.3.7.3 4.Thursday

- *JET and JT-60U current profile modelling with identity plasma experiments* (pptx [928]), by P.Siren
- *Modelling of JET hybrid scenarios with GLF23 transport model: effect of the ExB shear and betae stabilization on anomalous transport* (ppt [929]), by I.Voitsekhovitch
- *Short update on particle transport modelling following EPS conference: ideas on how to proceed* (ppt [930]), by L.Garzotti

10.3.7.4 5.Friday

- *Raport JET ISM Code camp: impurity simulations for JET 81856* (ppt [931]), by I.Ivanova-Stanik
- *Verification on the code ETS Impurity and ADAS with code SANCO for Ni* (ppt [932]), by I.Ivanova-Stanik
- *ACT1: Predictive modelling of Hybrid Scenarios and comparison to experimental data* (pdf [933]), by A.Figueiredo
- *JETTO Run to Benchmark ETS Neutrals Package* (ppt [934]), by F.Nave
- *ITER-like ramp-up: comparison experimental and synthesized polarimeter and MSE data* (ppt [935]), by G.M.D.Hogeweij

last update: 2013-06-27 by dpc

10.3.8 ISM Working Session March 11 - 15 2013 EFDA-Garching, Germany

10.3.8.1 1.Monday

- *Agenda, news from the 1st week of code camp* (pdf [947]), by I.Voitsekhovitch
- *Analysis and modelling of JET and JT-60U discharges* (pptx [948]), by J.Garcia
- *COREDIV physicsl model* (pdf [949]), by R.Stankiewicz
- *Modelling of the OH Ramp-Down Phase of JET Hybrid Pulses Using JETTO with Bohm-gyro-Bohm (BgB) Transport* (pdf [950]), by J.Bizarro
- *ASTRA-7 a state-of-the-art IPP transport code* (pdf [951]), by E.Fable

10.3.8.2 2.Tuesday

- *Benchmarking of new NBI version in ASTRA against NUBEAM/TRANSP* (ppt [952]), by I.Voitsekhovitch

10.3.8.3 3.Friday

- *Status of the NTM module on new Gateway 4.10a for ISM ACT1* (ppt [953]), by S.Nowak
- *European Transport Solver Status* (ppt [954]), by V.Basiuk
- *Code camp report* (pdf [955]), by A.Figueiredo
- *Modelling of tungtsen accumulation in pulses with ILW in JET* (ppt [956]), by Yu.Baranov
- *ACT1: status of impurity simulations for JET discharges (shot 82794, t=46s) with ETS* (ppt [957]), by I.Ivanova-Stanik
- *Linear Stability Chain in the new gateway* (ppt [958]), by F.Nabais
- *Role of Fast Ions on JET Hybrid Scenarios* (ppt [959]), by J.Garcia
- *ITER H-mode scenario with GLF23: impact of electromagnetic effects on fusion performance, effect of radiation* (ppt [960]), by F.Koechl
- *Integrated core-pedestal-SOL modelling for H-mode ITER scenario including impurity* (ppt [961]), by I.Ivanova-Stanik
- *Status of four field (Te, Ti, ni, Vtor) modelling for ITER* (ppt [962]), by I.Voitsekhovitch
- *Activity within ISM* (pptx [963]), by E.Barbato
- *Closing of working session* (pdf [964]), by I.Voitsekhovitch

10.3.9.2 4.Thursday "Joint ISM-IO meeting on integrated scenario modelling for ITER"

- *Agenda* (pdf [970]), by I.Voitsekhovitch
- *ITER Integrated Scenario Modelling needs* (pptx [971]), by A.Loarte
- *PARTICLE TRANSPORT WITH THEORY-BASED MODELS* (pptx [972]), by J.Garcia
- *Modelling pellet fuelling (but not only) for ITER* (pptx [973]), by L.Garzotti
- *Core-SOL Modelling of ELM mitigation at JET* (pdf [974]), by F.Koechl
- *Integrated core-SOL modelling including impurity: ITER H-mode plasma* (pdf [975]), by I.Voitsekhovitch
- *Current ramp up in ITER: effects of impurity density* (pdf [976]), by G.M.D.Hogeweij
- *RAPTOR capabilities for plasma simulation and control in ITER* (pdf [977]), by F.Felici
- *ITER Integrated Modelling Tools: Status and Outlook* (pptx [978]), by S.Pinches

10.3.9.3 5.Friday

- *Agenda* (pdf [979]), by I.Voitsekhovitch
- *Modelling of JET hybrid scenarios with European Transport Solver* (pdf [980]), by A.Figueiredo
- *ISM ACT1: progress in simulation of NTM effect in JET discharge* (pdf [981]), by S.Nowak
- *ACT1: Status of impurity modelling with ETS* (ppt [982]), by I.Ivanova-Stanik
- *Transport analysis of JET H-MODE and hybrid plasmas using Qualikiz, TGLF and GLF23* (pptx [983]), by B. Baiocchi
- *Progress on simulations of density profiles in hybrid plasmas* (pptx [984]), by L. Garzotti
- *Four-field simulations (ni, Te, Ti, Vtor, j) of ITER HS with GLF23 model: effect of toroidal rotation on fusion performance* (pdf [985]), by I. Voitsekhovitch
- *ACT2: JET current ramp up/down modelling* (pdf [986]), by D. Hogeweij
- *RAPTOR-based real-time observer: first ITER demonstration* (pdf [987]), by F. Felici
- *Numerical optimization of the actuator trajectories in ITER hybrid scenario* (pdf [988]), by J. van Dongen

10.3.10 ISM Working Session December 2 - 6 2013 JET, UK

10.3.10.1 1.Monday

- *Welcome and Agenda of 3rd ISM working session, news from 5th ITM code camp* (ppt [989]), by I.Voitsekhovitch

10.3.10.2 2.Tuesday

- *Heat transport study of H-MODE and hybrid plasmas using Qualikiz, TGLF and GLF23* (pdf [990]), by B.Baiocchi

10.3.10.3 4.Thursday

- *PROCESS DEMO1 simulations with JETTO+SANCO* (ppt [991]), by F.Koechl

10.3.10.4 5.Friday

- *Agenda* (ppt [992]), by I.Voitsekhovitch
- *JETTO Run to Benchmark ETS Neutrals Package* (pdf [993]), by F.Nave
- *Key impact of energetic ions on the establishment of advanced tokamak regimes* (pdf [994]), by J.Garcia
- *Physics comparison and modelling of the JET and JT-60U core and edge: towards JT-60SA predictions* (docx [995]), by J.Garcia
- *ACT2: Summary of the task on ELM mitigation by kicks* (ppt [996]), by F.Koechl
- *ASTRA-COREDIV simulations for ITER hybrid scenario* (ppt [997]), by I.Ivanova-Stanik
- *Modelling of JET hybrid scenarios with GLF23 transport model: ExB shear stabilisation of anomalous transport* (ppt [998]), by I. Voitsekhovitch

---

last update: 2015-02-06 by dpc

10.3.11 Remote meetings

10.3.11.1 September 29, 2010

- *Introduction meeting 29 September* (pdf [999]), by X.Litaudon
- *Progress of Hybrid modeling for JET and extrapolation to D-T* (pdf [1000]), by J.Garcia
- *Integrated edge modelling plans for ISM 2010/2011* (pdf [1001]), by S.Wiesen

10.3.11.2 October 27, 2010

- *Introduction meeting 27 October* (pdf [1002]), by X.Litaudon
- *Report from ITPA-IOS meeting, 18-21 October 2010, Seoul (modeling aspects)* (pdf [1003]), by X.Litaudon
- *Optimization of the EC Launchers* (pdf [1004]), by M.Henderson

10.3.11.3 November 10, 2010

- *Introduction meeting 10 November* (pdf [1005]), by X.Litaudon
- *Status of modelling of DIII-D current ramp up discharges and comparison with JET* (pdf [1006]), by I.Voitsekhovitch

10.3.11.4 November 24, 2010

- *Introduction meeting 24 November* (pdf [1007]), by X.Litaudon

10.3.11.5 January 19, 2011

- *Introduction meeting 19 January 2011* (pdf [1008]), by X.Litaudon
- *CRONOS / JETTO benchmark on JET hybrid pulses #77922 and #76858* (pdf [1009]), by F.Koechl
- *Optimisation of operational phase for long-pulse scenarios* (pdf [1010]), by A.Polevoi

10.3.11.6 February 9, 2011

- *Introduction meeting 9 February 2011* (pdf [1011]), by X.Litaudon
- *Report from ITM/IMP3 Code Camp: ETS V&V* (pdf [1012]), by I.Voitsekhovitch
- *Proposals for ETS validation on JET Hybrid discharges* (pdf [1013]), by I.Voitsekhovitch

10.3.11.7 February 16, 2011

- *Introduction meeting 16 February 2011* (pdf [1014]), by X.Litaudon
- *Benchmark the ETS/impurity code against SANCO* (pdf [1015]), by P.Belo
- *EMC3-EIRENE 3D fluid SOL code package* (pdf [1016]), by D.Harting
- *Proposals for ETS validation on JET Hybrid discharges* (pdf [1017]), by J.Garcia

10.3.11.8 March 2, 2011

- *Preparation of the ISM working session 7 - 11 March 2011, Cadarache* (ppt [1018]), by X.Litaudon

10.3.11.9 April 6, 2011

- *Introduction meeting 6 April 2011* (ppt [1019]), by X.Litaudon
- *Density modelling for hybrid scenario at JET & ITER, preliminary results* (pdf [1020]), by L.Garzotti
- *Validation exercise of the Kepler Workflow* (pdf [1021]), by V.Basiuk
- *Summary report on ISM WS & ETS CC: ETS benchmarking* (pdf [1022]), by I.Voitsekhovitch

10.3.11.10 April 27, 2011

- *Introduction meeting 27 April 2011* (pdf [1023]), by X.Litaudon
- *IOS/ITPA activities* (ppt [1024]), by X.Litaudon
- *Optimizing ITER Current Ramp-up for hybrid scenario* (pdf [1025]), by D.Hogeweij
- *Predictive transport analysis of JET and AUG hybrid scenarios* (ppt [1026]), by J.Citrin

10.3.11.11 May 11, 2011

- *Introduction meeting 11 May 2011* (pdf [1027]), by X.Litaudon
- *ETS V&V activity during coming Code Camp 23-27 May Helsinki* (pdf [1028]), by I.Voitsekhovitch
- *Analysis of the hybrid shot 77280* (pdf [1029]), by J.Garcia

10.3.11.12 June 8, 2011

- *Introduction meeting 8 June 2011* (pdf [1030]), by X.Litaudon
- *Summary of Chapter 2: Theoretical models and simulation codes* (pdf [1031]), by G.Giruzzi
- *Predictive transport simulations of JET L-mode plasmas: comparison between the GLF23 and the new TGLF model* (pdf [1032]), by E.Fable
- *Report on benchmarking of GLF23 model for toroidal velocity in ASTRA, CRONOS, FASTRAN, JETTO and ONETWO* (pdf [1033]), by I.Voitsekhovitch

10.3.11.13 June 22, 2011

- *Introduction meeting 22 June 2011* (pdf [1034]), by X.Litaudon
- *Density modelling for hybrid scenario at JET and ITER, preliminary results* (pdf [1035]), by L.Garzotti
- *ISM report: comparison between Kadomtsev and 'continuous' sawtooth reconnection model in JINTRAC* (pdf [1036]), by V.Parail
- *Simulations of the H to L transition in JET plasmas (EPS 2011)* (pdf [1037]), by P.Belo
- *Predictive transport analysis of JET and AUG hybrid scenarios (EPS 2011)* (pdf [1038]), by J.Citrin
- *Optimization of current ramp up phase for hybrid ITER discharges (EPS 2011)* (pdf [1039]), by G.M.D.Hogeweij

11 Infrastructure

The part of the ITM documentation addresses infrastructure related issues like the ITM Gateway (29) , ITM database access, the Universal Access Layer (UAL) (29) , and useful tools for handling CPOs (29) .

11.1 Mailing Lists

A number of ITM discussion mailing lists have been created:

- **itm-c_and_cpp** : To share C and C++ related topics
- **itm-data-struct** : Discussion about changes to ITM data structures
- **itm-fortran** : Use of FORTRAN within the ITM
- **itm-hpio** : Discussion about High Performance I/O
- **itm-matlab** : Use of MATLAB within the ITM
- **itm-plot** : Discussion of visualization in the ITM
- **itm-python** : Use of Python within the ITM
- **itm-tools** : Discussion of ITM tool needs
- **itm-workflow** : Discussion of issues related to workflows

These lists can be joined by clicking here [1139] and then clicking on "Subscribe/Unsubscribe/Preferences".

The ETS also has two mailing lists:

- **ets-announce** : ETS announcements list
- **ets-discuss** : ETS discussion list

These lists can be joined by clicking here [1140] and then clicking on "Subscribe/Unsubscribe/Preferences".

AMNS also has a mailing list:

- **amns-discuss** : AMNS Discussion List

This list can be joined by clicking here [1141] and then clicking on "Subscribe/Unsubscribe/Preferences".

11.2 ITM Gateway

under construction

---

last update: 2010-07-28 by konz

11.3 ITM Database

The tools below allow you to directly access the ITM data base without using the Universal Access Layer (UAL) (29) . This may prove useful when the UAL is not available.

11.3.1 printcpo

This Fortran90 program writes on the screen the non empty fields of the CPOs stored in the specified database entry.
It can be run directly from a unix shell:

```
unix prompt> printcpo <shot> <run> <treename>
```

where the parameters are the shot number, the run number, and the name of the MDSPLUS tree. If no parameters are provided, a default value of 1 is used for the shot number and the run number, while the treename default to euitm.

Example:

```
unix prompt> printcpo 3 2
```

In the current version, the program writes out the dimension of a field array, while it writes out the values of a scalar field to standard out.

The routine can also be used in a Fortran90 program.
Add the following use statement to your code:

```
  use euitm_printcpo
```

Call the routine like this:

```
  call printcpo(<cpo variable>)
```

Example:

```
    ...
    type(type_equilibrium),pointer :: equilibrium(:) => null()
    ...
    call euitm_get(idx, 'equilibrium', equilibrium)
    ...
    call printcpo(equilibrium)
```

The program files are hosted by the Gforge (29) project **itmshared** .
Check them out with

```
svn checkout https://gforge6.eufus.eu/svn/itmshared/branches/perlprintcpo target_dir
```

To build the program and the routines, just use the make facility:

```
unix prompt> make
```

The make uses the pgi compiler.

The files included are:

- `Makefile` - the Makefile
- `creaprint.pl` - a perl script which reads the definition of all data structures from the file euitm_schemas.f90 and writes the file euitm_printcpo.f90, which contains a module with all the routine needed to print a cpo.
- `creamainprint.pl` - writes the main program (printcpo.f90) based on the definitions in euitm_schemas.f90.
- `printcpoargs.f90` - routine that returns the arguments passed to the main program.

---

11.4 Universal Access Layer (UAL)

11.4.1 Introduction

The UAL (Universal Access Layer) (29) is a multi-language library that allows exchanging Consistent Physical Objects (CPOs) between various modules, and to write to an ITM database. The documentation here is provided for rather experienced users who want to practice the UAL in their test programs. Regular KEPLER (29) users do not need to know anything about the UAL. KEPLER manages transparently the UAL calls, which are embedded in the physics code wrappers. **No UAL calls should be made inside physics modules.**

Prior using the UAL, the environment must be configured. It is recommended to use the **ITMv1** script for this, which simultanesouly sets i) the database environment (to the private database of the user) ii) the UAL libraries environment iii) the Kepler environment.

```
        source $ITMSCRIPTDIR/ITMv1 KEPLERFOLDER
        MACHINENAME DATAVERSION
```

e.g.:

```
        source $ITMSCRIPTDIR/ITMv1 kepler tore_supra 4.08a
```

This scripts does not prevent you from using databases from other users or the public one, you must then use the UAL function **euitm_open_env** in your program to do so.

The ITMv1 script uses the two following scripts: to set the database environment variables (mandatory prior UAL usage), use:

```
source $ITMSCRIPTDIR/set_itm_data_env USERNAME
 MACHINENAME DATAVERSION
```

e.g.:

```
source $ITMSCRIPTDIR/set_itm_data_env myname jet 4.08a
```

Then to set the path to the right UAL libraries, use:

```
source $ITMSCRIPTDIR/set_itm_env DATAVERSION
```

e.g.:

```
source $ITMSCRIPTDIR/set_itm_env 4.08a
```

UAL libraries are installed in `/afs/efda-itm.eu/isip/project/switm/ual` .

The source code is stored in a subversion repository in /afs/edfa-itm.eu/isip/project/portal/gforge/storage/svnroot/ual. To check out a subversion working copy of the repository, storing it in subdirectory *ual* , do

```
svn co https://gforge6.eufus.eu/svn/ual
```

11.4.2 UAL User Guide

Click on the following link for the UAL User Guide [1142]

---

last update: 2019-01-31 by g2dpc

11.5 Handling CPOs

The tools below allow you to perform useful operations on the ITM datastructures including entire CPOs (29) in your Fortran90 workflows. They are not meant as a replacement of the Universal Access Layer (UAL) (29) but rather as a complement especially in situations where the UAL is not available or not practical, e.g. in U.S. - EFDA collaborations.

11.5.1 Module deallocate_stuctures

This Fortran90 module allows you to deallocate in a very simple way any ITM data structure which is defined in euitm_schemas.f90.

Add the following use statement to your code:

```
  use deallocate_structures
```

The Fortran syntax for deallocating a cpo is then:

```
  call deallocate_cpo(cpo)
```

where cpo is a single time slice or a pointer array of a CPO (or other ITM data structure).

With

```
   call set_deallocate_verbosity(verbosity)
```

you can set a verbosity level for the deallocate routines. `verbosity = 0` produces no output, whereas `verbosity > 0` produces verbose output.

The module `deallocate_structures.f90` is hosted by the Gforge (29) project **itmshared** .
Check it out with

```
svn checkout https://gforge6.eufus.eu/svn/itmshared/branches/tools target_dir
```

Two static libraries `libdeallocate_pgi.a` and `libdeallocate_g95.a` have been prebuilt on the ITM Gateway (29) .

[1142] https://www.efda-itm.eu/ITM/imports/isip/public/isip_UAL_User_Guide.pdf

11.5.2 Module copy_structures

This Fortran90 module allows you to copy in a very simple way any ITM data structure which is defined in euitm_schemas.f90.

Add the following use statement to your code:

```
use copy_structures
```

The Fortran syntax for copying a cpo is then:

```
call copy_cpo(cpo_source, cpo_target)
```

where cpo_source and cpo_target are single time slices or arrays of a CPO (or other ITM data structure) of the same derived type, real scalars, or real arrays (1D - 7D).
The allocation of the elements of the target structure is done automatically.

With

```
call set_copy_verbosity(verbosity)
```

you can set a verbosity level for the copy routines. `verbosity = 0` produces no output, whereas `verbosity > 0` produces verbose output.

The module `copy_structures.f90` is hosted by the Gforge (29) project **itmshared** .
Check it out with

```
svn checkout https://gforge6.eufus.eu/svn/itmshared/branches/tools target_dir
```

Two static libraries `libcopy_pgi.a` and `libcopy_g95.a` have been prebuilt on the ITM Gateway (29) .

11.5.3 Module euitm_copy

This Fortran90 module allows you to copy in a very simple way any ITM data structure which is defined in euitm_schemas.f90 including entire trim traces.

Add the following use statement to your code:

```
use euitm_copy
```

The Fortran syntax for copying a cpo via assignment is then:

```
cpo_target = cpo_source
```

where cpo_source and cpo_target are single time slices or arrays of a CPO (or other ITM data structure) of the same derived type.
The allocation of the elements of the target structure is done automatically.

The program files are hosted by the Gforge project **itmshared** .
Check them out with

```
svn checkout https://gforge6.eufus.eu/svn/itmshared/branches/perlcopy target_dir
```

To build the Fortran90 module, run

```
creacopy.pl
```

It takes euitm_schemas.f90 from the directory `$UAL/fortraninterface/` .
Or supply the file from a given directory

```
creacopy.pl $MYDIR/euitm_schemas.f90
```

11.5.4 Module is_set_structures

This Fortran90 module can be used to check whether ITM data structures including entire CPOs have been set. The subroutines in `is_set_structures.f90` write out the name of each element in the data structure together with `'T'` if it has been set or `'F'` if not.

Add the following use statement to your code:

```
use is_set_structures
```

The Fortran syntax for checking a cpo is then:

```
call is_set_cpo(cpo, "name of cpo")
```

where cpo is a single time slice or an array of a CPO (or other ITM data structure) and ”name of cpo” is a string containing the name of the CPO.

The module `is_set_structures.f90` is hosted by the Gforge (29) project **itmshared** .
Check it out with

```
svn checkout https://gforge6.eufus.eu/svn/itmshared/branches/tools target_dir
```

Two static libraries `libis_set_pgi.a` and `libis_set_g95.a` have been prebuilt on the ITM Gateway (29) .

11.5.5 Module size_of_structures

The subroutines in `size_of_structures.f90` write out the name of each element in the data structure with its size, the size of each entire substructure, and the size of the entire CPO. The size can be given in bytes or in a more human friendly format depending on the value of the logical parameter `human_readable` . The indentation is done in steps of 2 blanks with an initial indentation of 1.
The maximum depth to which the results are displayed is specified by a call to `set_size_of_maxlevel` . Output of empty fields can be suppressed by setting the verbosity to zero with a call to `set_size_of_verbosity` . In all cases, sums are carried out over all levels.

Add the following use statement to your code:

```
use size_of_structures
```

The Fortran syntax for calculating the size of a cpo is then:

```
call size_of_cpo(cpo, total_size, human_readable, "name of cpo")
```

where cpo is a single time slice or an array of a CPO (or other ITM data structure) and ”name of cpo” is a string containing the name of the CPO. total_size is an integer and should be set to zero before the call. human_readable is a flag (true => human friendly format).

Set the verbosity with:

```
call set_size_of_verbosity(verbosity)
```

verbosity = 0 => no output of empty fields
verbosity > 0 => full output

Set the maximum depth with:

```
call set_size_of_maxlevel(level)
```

with level being an integer.

The module `size_of_structures.f90` is hosted by the Gforge (29) project **itmshared** .
Check it out with

```
svn checkout https://gforge6.eufus.eu/svn/itmshared/branches/tools target_dir
```

Two static libraries `libsize_of_pgi.a` and `libsize_of_g95.a` have been prebuilt on the ITM Gateway (29) .

11.5.6 Module write_structures

This Fortran90 module can be used to write ITM data structures including entire CPOs to disk.
The corresponding file is opened with

```
call open_write_file(unit_no, file_name)
```

where unit_no is the file handle (integer) and file_name a string with the file name (possibly including the path).

The file is closed with

```
call close_write_file
```

Add the following use statement to your code:

```
use write_structures
```

The Fortran syntax for writing a cpo to disk is then:

```
call write_cpo(cpo, "name of cpo")
```

where cpo is a single time slice or an array of a CPO (or other ITM data structure) and "name of cpo" is a string containing the name of the CPO.

With

```
call set_write_verbosity(verbosity)
```

you can set a verbosity level for the write routines. verbosity = 0 produces no output, whereas verbosity > 0 produces verbose output.

The module `write_structures.f90` is hosted by the Gforge (29) project **itmshared** .
Check it out with

```
svn checkout https://gforge6.eufus.eu/svn/itmshared/branches/tools target_dir
```

Two static libraries `libwrite_pgi.a` and `libwrite_g95.a` have been prebuilt on the ITM Gateway (29) .

11.5.7 Module read_structures

This Fortran90 module can be used to read ITM data structures including entire CPOs from disk.
The corresponding file is opened with

```
call open_read_file(unit_no, file_name)
```

where unit_no is the file handle (integer) and file_name a string with the file name (possibly including the path).

The file is closed with

```
call close_read_file
```

Add the following use statement to your code:

```
use read_structures
```

The Fortran syntax for reading a cpo from disk is then:

```
call read_cpo(cpo, "name of cpo")
```

where cpo is a single time slice or an array of a CPO (or other ITM data structure) and ”name of cpo” is a string containing the name of the CPO. The module automatically deallocates any fields already allocated in cpo and allocates all required fields automatically. It is absolutely essential that ”name of cpo” is identical with the one chosen when the cpo was written.

With

```
call set_read_verbosity(verbosity)
```

you can set a verbosity level for the read routines. verbosity = 0 produces no output, whereas verbosity > 0 produces verbose output.

The module `read_structures.f90` is hosted by the Gforge (29) project **itmshared** .
Check it out with

```
svn checkout https://gforge6.eufus.eu/svn/itmshared/branches/tools target_dir
```

Two static libraries `libread_pgi.a` and `libread_g95.a` have been prebuilt on the ITM Gateway (29) .

11.5.8 Module diff_structures

This Fortran90 module can be used to compare two CPOs or other ITM data structures. It was developed to facilitate benchmarks and automated test suites for the code development. It was kept flexible through the use of function arguments in the argument list of the subroutines of diff_structures. This allows the user to specify his own function set for the analysis and evalutation of the differences between the two CPOs. A call to diff_cpo simply writes out the result of this user defined function.

Add the following use statements to your code:

```
use diff_structures
use error_analysis
```

The Fortran syntax for calculating the differences between two cpos is then:

```
call diff_cpo(reference_cpo, test_cpo, name_root, func)
```

where reference_cpo is the reference CPO or other ITM data structure and test_cpo is the test CPO or other ITM data structure.
name_root is a string which defines the root of the field names to be displayed, e.g. 'equilibrium'.
func is a function argument to the subroutine diff_cpo. It can be any user defined function with the following constraints:

- It must be defined inside the module error_analysis (an example version with various error analysis functions is provided in `error_analysis.f90`).
- It follows the structure (dummy arguments, interface, overloading) as demonstrated in error_analysis.f90. The function always has a header function with a list of optional dummy arguments. Depending on which actual arguments are specified, this functions calls the overloaded function with the correct arguments. The interim function is required because of Fortran90/95 limitations. The actual error analysis is carried out inside the overloaded functions. Two fields of these functions are intent(inout) variables:

  ```
  diff_counter : to count the number of difference
  error_level  : to allow for sums or averages over entire CPOs (see examples)
  ```

  These two variables are private to the error_analysis module.
  To access them please use the functions

  ```
  get_diff_counter()
  ```

  and

  ```
  get_error_level()
  ```

  The function

  ```
  set_error_level(err_level)
  ```

  may be used to specify an initial value for the variable `error_level` .

With

```
call set_diff_verbosity(verbosity)
```

you can set a verbosity level for the diff routines. verbosity = 0 produces no output, whereas verbosity > 0 produces verbose output.

The file `check_equilibrium.f90` represents a simple example for a program to compare two equilibrium CPOs one of which is used as a reference for test cases in code development. It clearly demonstrates the use of the diff_structures module.

The module `diff_structures.f90` and the auxiliary file `error_analysis.f90` and `check_equilibrium.f90` are hosted by the Gforge (29) project **itmshared** .
Check them out with

```
svn checkout https://gforge6.eufus.eu/svn/itmshared/branches/tools target_dir
```

Two static libraries `libdiff_pgi.a` and `libdiff_g95.a` have been prebuilt on the ITM Gateway (29) .

12 Conventions

12.1 Standard Machine Names

The following machine names are suggested:

- aug
- ftu
- iter
- jet
- mast
- tcv
- tore_supra
- west

12.2 Physics Conventions

The ITM-TF has agreed on a variety of conventions to facilitate the integration of the code modules across EFDA.
In the following the most important conventions are explained in detail to remove confusion and avoid ambiguity. For more physical detail than that represented here see F Hinton and R Hazeltine, *Rev Mod Phys* **48** (1976) 239-308, or R Hazeltine and J Meiss, *Plasma Confinement* (Addison-Wesley, 1992).

12.2.1 Coordinate System

There are generally two choices for defining a right-handed coordinate system in a toroidal geometry with the following coordinates:

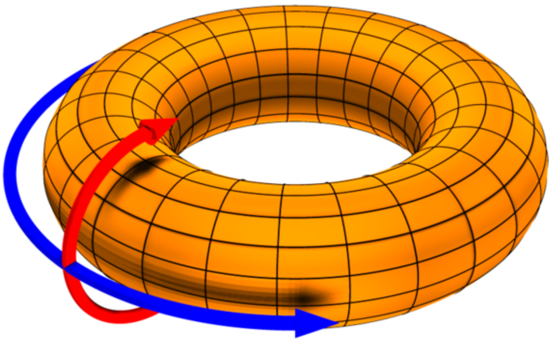
- major radius R
- vertical heights Z
- toroidal angle ϕ

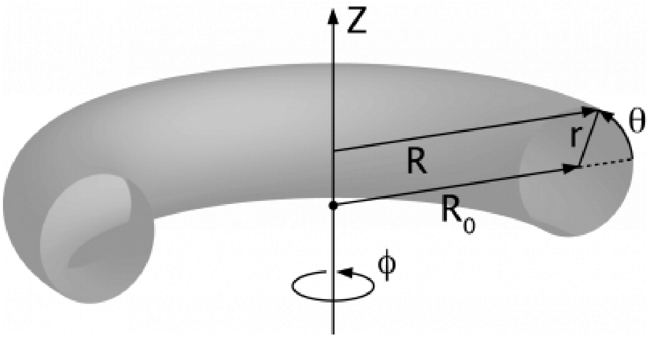
Remaining consistent with ITER, the ITM-TF has chosen to adopt the right-handed system

$$\boxed{(R, \phi, Z)}$$

i.e. R is to the right, Z is upwards, and ϕ points into the plane on the right-hand side of the torus (i.e. mathematically positive). Looking from above, the toroidal angle is counter-clockwise, i.e. mathematically positive.

The following figures demonstrate the orientation of the toroidal angle ϕ and the poloidal angle θ :





source:
http://www-fusion.ciemat.es/fusionwiki/index.php/Toroidal_coordinates [1143]
http://en.wikipedia.org/wiki/Toroidal_and_poloidal [1144]

12.2.2 Representation of the Magnetic Field and Current

Generally, the magnetic field is described in terms of two scalar fields as it is divergence free. If the field is also axisymmetric then MHD equilibrium demands these are functions of each other. In the ITM-TF the relevant quantities are F_{dia} and Ψ and the representation is

$$\mathbf{B} = F_{\mathrm{dia}} \nabla \phi + (2\pi)^{-1} \nabla \Psi \times \nabla \phi$$

where the factor of 2π is to have Ψ

one and the same with the poloidal flux in Webers (see below).

The current given by Ampere's law is

$$\mu_0 \mathbf{J} = \nabla F_{\mathrm{dia}} \times \nabla \phi - (2\pi)^{-1} (R^2 \nabla \cdot R^{-2} \nabla \Psi) \nabla \phi$$

The respective covariant toroidal components are useful forms:

$$B_\phi = F_{\mathrm{dia}} \qquad \mu_0 J_\phi = -(2\pi)^{-1} (R^2 \nabla \cdot R^{-2} \nabla \Psi)$$

where the latter is often expressed in terms of the "delta-star" operator, $\Delta^* = R^2 \nabla \cdot R^{-2} \nabla$.
These are not the toroidal field and current but the toroidal field and current multiplied by R respectively. The total plasma current I_p is the integral of J_ϕ / R

over the poloidal cross section (usually, but not always, over the closed flux surface region only).

12.2.3 Poloidal and Toroidal Fluxes

The toroidal flux Φ is the integral of B_ϕ/R over the region enclosed by the flux surface. Due to axisymmetry it is also a volume integral

$$\Phi = \oint d^3V\,(2\pi R^2)^{-1}\,F_{\mathrm{dia}}$$

All volume integrals are understood as integration over the region enclosed by the flux surface. They are therefore flux quantities (pure functions of Ψ). The units of Φ are volt-seconds, or Webers (Wb).

The poloidal flux is Ψ due to the construction of **B** . The factor of 2π

ensures this is not Wb per radian (the more usual quantity ψ used as a covariant toroidal component of the magnetic potential is in Wb/radian; the factor of 2π results from integration over one angular circuit). Note that the poloidal flux Ψ and its equivalent per radian ψ are often used equivalently in the literature.

12.2.4 Safety Factor

The magnetic pitch parameter is defined in terms of the flux components:

$$q \equiv d\Phi/d\Psi$$

which is a flux quantity. This definition is the same as saying the magnetic pitch is given as the number of toroidal cycle a magnetic field line traverses per unit poloidal cycle. It is also called the local safety factor for MHD stability reasons (here, ”local” means local to a given flux surface). Equivalent relations often seen depend on the definition of coordinates. These are given for straight field line coordinates, below.

12.2.5 Signs

With the above definition of the toroidal coordinate system and the magnetic field, the following sign relationships ensue (where increasing and decreasing refer to going from the magnetic axis to the separatrix on the outboard midplane):

Table 4769: Sign Relations

B_{tor}	I_p	Ψ	Φ	**safety factor** q
positive	positive	decreasing	increasing	negative
positive	negative	increasing	increasing	positive
negative	positive	decreasing	decreasing	positive
negative	negative	increasing	decreasing	negative

12.2.6 COCOS - toroidal coordinate conventions

16 different fundamental coordinate conventions (COCOS) has been identified for toroidal systems. These are described by O. Sauter and S. Yu. Medvedev, Computer Phys. Commun. 184 (2013) 293 [1145], and summarized in the figure below.

[1145] http://www.sciencedirect.com/science/article/pii/S0010465512002962

Table 1
(a) Coordinate conventions for each *COCOS* index. *COCOS* ≤ 8 refers to ψ divided by (2π) and thus with $e_{Bp} = 0$ while *COCOS* ≥ 11 refers to full poloidal flux with $e_{Bp} = 1$. Otherwise *COCOS* $= i$ and *COCOS* $= 10 + i$ have the same coordinate conventions. The cylindrical (with the related $\sigma_{R\varphi Z}$ value) and poloidal (with $\sigma_{\rho\theta\varphi}$) right-handed coordinate systems are given as well. (b) The indications in this subtable (last three columns) are assuming I_p and B_0 positive in the related coordinate system, that is in the direction of the related φ.

COCOS	e_{Bp}	σ_{Bp}	Cylind, $\sigma_{R\varphi Z}$	Poloid, $\sigma_{\rho\theta\varphi}$	φ from top	θ from front	ψ_{ref}	sign(q)	sign $\left(\frac{dp}{d\psi}\right)$
1/11	0/1	$+1$	$(R,\varphi,Z),+1$	$(\rho,\theta,\varphi),+1$	Cnt-clockwise	Clockwise	Increasing	$+1$	-1
2/12	0/1	$+1$	$(R,Z,\varphi),-1$	$(\rho,\theta,\varphi),+1$	Clockwise	Cnt-clockwise	Increasing	$+1$	-1
3/13	0/1	-1	$(R,\varphi,Z),+1$	$(\rho,\varphi,\theta),-1$	Cnt-clockwise	Cnt-clockwise	Decreasing	-1	$+1$
4/14	0/1	-1	$(R,Z,\varphi),-1$	$(\rho,\varphi,\theta),-1$	Clockwise	Clockwise	Decreasing	-1	$+1$
5/15	0/1	$+1$	$(R,\varphi,Z),+1$	$(\rho,\varphi,\theta),-1$	Cnt-clockwise	Cnt-clockwise	Increasing	-1	-1
6/16	0/1	$+1$	$(R,Z,\varphi),-1$	$(\rho,\varphi,\theta),-1$	Clockwise	Clockwise	Increasing	-1	-1
7/17	0/1	-1	$(R,\varphi,Z),+1$	$(\rho,\theta,\varphi),+1$	Cnt-clockwise	Clockwise	Decreasing	$+1$	$+1$
8/18	0/1	-1	$(R,Z,\varphi),-1$	$(\rho,\theta,\varphi),+1$	Clockwise	Cnt-clockwise	Decreasing	$+1$	$+1$
			(a)					(b)	

The current ITM convention (described above) is number 13, while the ITER convention is 11.

12.2.6.1 Determining the COCOS number

V. CHECKING THE CONSISTENCY OF EQUILIBRIUM QUANTITIES/ASSUMPTION WITH A *COCOS* INDEX

Let us obtain conditions of consistency of an input equilibrium with a specific *COCOS* index, generalizing Eq. (22). For this, it is easier to use Eq. (21) and to note that since with the CHEASE normalization we have I_p and B_0 positive, we should have I_p and F positive, ψ_{chease} increasing, $dp/d\psi_{chease}$ negative and q positive (from Table I, $COCOS = 2$ line). Thus, using Eq. (21) we should have for any *cocos* equilibrium:

$$
\begin{aligned}
\sigma_{Ip} &= sign(I_p), \\
\sigma_{B_0} &= sign(B_0), \\
sign(F_{cocos}) &= \sigma_{B_0}, \\
sign(\Phi_{cocos}) &= \sigma_{B_0}, \\
sign\big[\psi_{cocos}(\text{edge}) - \psi_{cocos}(\text{axis})\big] &= \sigma_{Ip}\,\sigma_{Bp,cocos}, \\
sign(\left.\frac{dp}{d\psi}\right|_{cocos}) &= -\,\sigma_{Ip}\,\sigma_{Bp,cocos}, \\
sign(j_{cocos}) &= \sigma_{Ip}, \\
sign(q_{cocos}) &= \sigma_{Ip}\,\sigma_{B_0}\,\sigma_{\rho\theta\varphi},
\end{aligned}
\tag{23}
$$

with $\sigma_{Bp,cocos}, \sigma_{\rho\theta\varphi}$ given in Table I for the related *cocos* value. Note that the sign of $dp/d\psi$ being $-\sigma_{Ip}\sigma_{Bp,cocos}$ should be understood as the "main" $sign(dp/d\psi)$ following the fact that pressure is usually much larger on axis than at the edge. To be more precise one could replace this relation by $sign(\sum_0^{\text{edge}} \frac{dp}{d\psi}\,\Delta\psi) = -1$.

It should be noted that Eq. (23) can also be used to determine the *COCOS* used in a code or set of equations. Usually, one starts by checking if ψ is increasing or decreasing from magnetic axis to the edge. Then, depending on $sign(I_P)$, one can obtain the value of $\sigma_{Bp,cocos}$. Another way is if $\mathbf{B}_p \sim \nabla\varphi \times \nabla\psi$, thus $\sigma_{Bp,cocos} = +1$ or $\mathbf{B}_p \sim \nabla\psi \times \nabla\varphi$, yielding $\sigma_{Bp,cocos} = -1$. Then one can check with the sign of $dp/d\psi$. The next step is to determine $\sigma_{R\varphi Z}$, either from the comparison of the sign of I_p and B_0 with the effective direction of I_p and B_0 if it is known, or by comparing the definition of B_R, for example, with Eqs. (12) and (13) and taking into account the value of σ_{Bp}. Then, the effective sign of q gives the value of $\sigma_{\rho\theta\varphi}$. Finally, e_{Bp} is obtained from the factor 2π appearing either in the definition of $\mathbf{B}_p$, Eq. (1), giving $e_{Bp} = 1$ or in the definition of q, Eq. (9), yielding $e_{Bp} = 0$. Note that if a specific sign of I_p or B_0 is used, it should be used in Eq. (23) to infer the *COCOS* value. In particular, some codes (Table IV) use a different sign for I_p and B_0, yielding a different effective sign of q.

12.2.6.2 Equilibrium COCOS transformation library and actor

A Fortran library has been developed for transforming the equilibrium cpo between different COCOS. The source is found in

```
https://gforge6.eufus.eu/svn/numerical_tools/tags/COCOStransform_v1_1
```

and the actor is

```
https://gforge6.eufus.eu/svn/kepleractors/tags/4.09a/imp12/COCOStransformequil.tar
```

(also available from: ~sauter/public/ACTORS/4.09a)

Inputs:

- `Equilibrium_in` : input cpo
- `COCOS_in` : COCOS of the input equilibrium (if the COCOS is not stored in Equilibrium_in)
- `COCOS_out` : Requested COCOS for the Equilibrium_out
- `Ipsign_out` : Requested sign for output Ip; -9 if just wants IP_in transformed to new equilibrium, +1 or -1 if a specific sign in output is desired
- `B0sign_out` : Requested sign for output B0

Output:

- `Equilibrium_out` : Output cpo

12.2.7 The Flux Surface Average

In general, the flux surface average is the operation which annihilates the magnetic derivative $\mathbf{B}\cdot\nabla$ and acts as an identity operator on any flux quantity. It can be proved that this results in a volume derivative of a volume integral (alternatively one starts with the latter property and then proves the former, as the above Ciemat reference does).

The flux surface average of a scalar and divergence of a vector are given by

$$\langle G\rangle = \frac{\partial}{\partial V}\oint d^3V\,G \qquad\qquad \langle\nabla\cdot\mathbf{G}\rangle = \frac{\partial}{\partial V}\langle\mathbf{G}\cdot\nabla V\rangle$$

where $\mathbf{G}\cdot\nabla V$ is the contravariant volume component of the vector $\mathbf{G}$.

It follows that the flux surface average is an angle average weighted by the volume element $\sqrt{g}$

$$\langle G\rangle = \oint d\phi \oint d\theta\,\sqrt{g}\,G \,/ \oint d\phi \oint d\theta\,\sqrt{g}$$

for any choice of toroidal and poloidal angle as well as radial coordinates, where g is the determinant of the covariant metric tensor components in those coordinates.

Note in general G is not an axisymmetric quantity so the integration is actually over both angles.

For more detail see the above references.

12.2.8 The Toroidal Flux Radius as the Radial Coordinate

The ITM-TF has decided to use the toroidal flux radius ρ_{tor} defined by

$$\Phi = \pi B_0 \rho_{\mathrm{tor}}^2$$

where B_0 is the reference (vacuum) magnetic field value. Note that $\rho_{\rm tor}$

is a positive quantity which has units of meters.
For several applications the volume radius $\rho_{\rm vol}$ is also used. It is a normalised radius going from 0 to 1 and is defined as

$$V = V_{\rm LCFS}\rho_{\rm vol}^2$$

where LCFS refers to the last closed flux surface.
Both should be defined in the equilibrium CPO (as well as `volume` $\equiv V$ itself).

12.2.9 Toroidal and Parallel Current

These are not equivalent, despite the often-seen experimental practice of considering them so. The toroidal current given in Amperes depends on some convention applied to J_ϕ given above, which is *not* a flux quantity. The ITM-TF has decided on this definition of the toroidal current as a flux quantity:

$$\texttt{jphi} \equiv \langle J^\phi\rangle / \langle 1/R\rangle$$

This uses the contravariant toroidal component of $\mathbf{J}$ which is a pure divergence

$$J^\phi = \mathbf{J}\cdot\nabla\phi = J_\phi/R^2 = -\nabla\cdot(2\pi\mu_0 R^2)^{-1}\nabla\Psi$$

Hence the flux surface average invokes the often-used quantity $\langle g^{\rho\rho}/R^2\rangle$ in the form

$$\langle J^\phi\rangle = -(2\pi\mu_0)^{-1}\frac{1}{V'_\rho}\frac{\partial}{\partial\rho}V'_\rho\langle g^{\rho\rho}/R^2\rangle\frac{\partial\Psi}{\partial\rho}$$

Here, $V'_\rho \equiv \partial V/\partial\rho_{\rm tor}$ explicitly using the toroidal flux radius as the radial coordinate.

The parallel current is different from this due to the finiteness of the poloidal current and magnetic field. Generally the correction is $O(\epsilon^2/q^2)$ which is usually a few percent (but *not* in a spherical tokamak). Using the representations for $\mathbf{B}$ and $\mathbf{J}$ given above we find

$$\mathbf{J}\cdot\mathbf{B} = -(2\pi\mu_0)^{-1}\,F_{\rm dia}^2\nabla\cdot\frac{1}{F_{\rm dia}R^2}\nabla\Psi$$

Since $F_{\rm dia}$ is a flux quantity the flux surface average behaves as for `jphi` and we use a factor of B_0 to provide the correct units, yielding

$$\texttt{jparallel} \equiv -(2\pi\mu_0 B_0)^{-1}\frac{F_{\rm dia}^2}{V'_\rho}\frac{\partial}{\partial\rho}\frac{V'_\rho}{F_{\rm dia}}\langle g^{\rho\rho}/R^2\rangle\frac{\partial\Psi}{\partial\rho}$$

This form has been chosen due to the natural use of the flux surface average $\langle\mathbf{J}\cdot\mathbf{B}\rangle$ in neoclassical theory and the magnetic flux diffusion equation (see the Hinton and Hazeltine reference above).

12.2.10 Straight Field Line Coordinates

A variety of modules in the ITM-TF use straight field line coordinate systems to represent the closed flux surface region.
To guarantee consistency with the definition of the poloidal flux and the magnetic field representation given above, a standard definition of the coordinate volume element follows. This is the same sense as the usage of the term "Jacobian" in the CPOs (note many papers use the inverse volume element as the "Jacobian" by contrast).
Here, "straight field line coordinates" refers to the use of the right-handed coordinate system (Ψ, θ, ζ) with

the poloidal flux Ψ , the straight field line angle θ , and the toroidal angle $\zeta = -\phi$. Therefore, θ has the same orientation as the poloidal angle θ in toroidal coordinates, while the toroidal angle ζ is in the opposite direction of ϕ . This is standard usage generally in terms of "flux coordinates" (see Hazeltine and Meiss, above).

Note here that while the toroidal angle is the geometric one in the orientation sense of flux coordinates, the poloidal angle is not geometric. This results from the demand that the field lines be straight in the coordinate plane (θ, ζ) . The definition of this property is given by the specification of the ratio of contravariant components of the magnetic field as a flux quantity, which is one and the same with the pitch parameter ("local safety factor"):

$$q = q(\Psi) = -B^{\zeta}/B^{\theta} = B^{\phi}/B^{\theta}$$

where the minus sign appears by consistency with the primary definition in terms of the flux components as given above. This represents a magnetic differential equation for the poloidal angle:

$$B^{\theta} = B^{\phi}/q = F_{\mathrm{dia}}/qR^2$$

Due to the choice of "natural" coordinates (with Ψ , not ρ_{tor}) this relation is close to the definition of the volume element $\sqrt{g}$ and, equivalently, the Jacobian J

$$J \equiv \sqrt{g} \qquad J^{-1} = \nabla\Psi \cdot \nabla\theta \times \nabla\zeta = \nabla\Psi \times \nabla\phi \cdot \nabla\theta$$

Note the ordering of $\nabla\Psi$ and $\nabla\phi$.
The components of the magnetic field are then

$$\begin{aligned} B^{\theta} &= \mathbf{B} \cdot \nabla\theta = (2\pi)^{-1}\nabla\Psi \times \nabla\phi \cdot \nabla\theta = (2\pi J)^{-1} \\ B^{\zeta} &= \mathbf{B} \cdot \nabla\zeta = -B_{\phi}/R^2 = -F_{\mathrm{dia}}/R^2 \\ B^{\Psi} &= \mathbf{B} \cdot \nabla\Psi = 0 \end{aligned}$$

With these relations the following relationship between the Jacobian and pitch parameter ("local safety factor") holds

$$J = (2\pi)^{-1}\, qR^2/F_{\mathrm{dia}}$$

This is the quantity labelled `jacobian` in the equilibrium CPO.

12.2.11 Plasma Betas

Out of the many definitions of plasma betas, the ITM has agreed to adhere to the following definitions:

Following Wesson (p. 116), the **poloidal beta** is defined as an integral over the poloidal cross section

$$\beta_{\mathrm{p}} = \frac{2\mu_0}{B_{\mathrm{a}}^2}\frac{\int_A p\mathrm{dS}}{\int_A \mathrm{dS}}$$

where $A = A(\Psi)$ is the poloidal cross section enclosed by the flux surface Ψ , $B_{\mathrm{a}} = \frac{\mu_0 I}{l}$ is the flux surface averaged poloidal magnetic field, $I = I(\Psi)$ the toroidal plasma current inside the flux surface Ψ and $l = \oint \mathrm{dl}$ the length of the poloidal perimeter of flux surface Ψ .
This definition yields a one-dimensional profile $\beta_{\mathrm{p}} = \beta_{\mathrm{p}}(\Psi)$ stored in `profiles_1d%beta_pol` in the equilibrium CPO (29) . The overall poloidal beta $\beta_{\mathrm{p}}(\Psi = \Psi_{\mathrm{bd}})$ is stored in `global_param%beta_pol` .

The **toroidal beta** is defined as

$$\beta_{\mathrm{tor}} = \frac{2\mu_0}{B_0^2}\frac{\int_\Omega p\mathrm{dV}}{\int_\Omega \mathrm{dV}}$$

with B_0 the vacuum magnetic field as stored in `global_param%toroid_field%b0` . The integral is carried out over the entire plasma volume and the result stored in `global_param%beta_tor` .

The normalized plasma beta is defined as

$$\beta_{\mathrm{N}} = 100 \frac{aB_0}{10^{-6} I_{\mathrm{p}}} \beta_{\mathrm{tor}}$$

with I_{p} the total plasma current (following Y.-S. Na et al., *PPCF* **44** (2002), 1285) and **a** is the minor radius. It is stored in `global_param%beta_normal` .

12.2.12 Internal Inductance

The definition of the internal inductance follows J.A. Romero et al., *NF* **50** (2010), 115002. The magnetic energy contained inside the flux surface Ψ is
$W_{\mathrm{mag}} = \frac{1}{2\mu_0} \int_\Omega B_{\mathrm{p}}^2 \mathrm{dV}$
where B_{p} is the poloidal component of the magnetic field.
The (unnormalized) internal inductance is then defined as
$L_{\mathrm{i}} = \frac{2W_{\mathrm{mag}}}{I^2}$
where $I = I(\Psi)$ is the toroidal plasma current enclosed by the flux surface Ψ .
The normalized internal inductance, as stored in `profiles_1d%li` is defined as

$$l_{\mathrm{i}} = \frac{2L_{\mathrm{i}}}{\mu_0 \bar{R}}$$

with the surface averaged major radius
$\bar{R} = \frac{\int_A R \mathrm{dS}}{\int_A \mathrm{dS}} = \frac{V(\Psi)}{2\pi A(\Psi)}$.
The overall internal inductance $l_{\mathrm{i}}(\Psi = \Psi_{\mathrm{bd}})$ is stored in `global_param%li` .

12.2.13 Poloidal Angle Dimension in Equilibrium CPO

The following entries in the equilibrium CPO (29) are defined along the poloidal dimension (as dim2 in the case of a flux surface equilibrium, i.e. radial coordinate psi in dim1 and poloidal angle in dim2):

```
coord_sys%jacobian(:,:)
coord_sys%g_11(:,:)
coord_sys%g_12(:,:)
coord_sys%g_13(:,:)
coord_sys%g_22(:,:)
coord_sys%g_23(:,:)
coord_sys%g_33(:,:)
profiles_2d%position
profiles_2d%grid
profiles_2d%psi_grid(:,:)
profiles_2d%jphi_grid(:,:)
profiles_2d%jpar_grid(:,:)
profiles_2d%br(:,:)
profiles_2d%bz(:,:)
profiles_2d%bphi(:,:)
```

The ITM-TF has decided not to repeat the first poloidal point (with poloidal angle $\theta = 0$), which is identical to $\theta = 2\pi$. This option was chosen to facilitate Fourier transforms along the poloidal direction. To that purpose it is required that the dimension dim2 be equidistant in the poloidal angle θ

(going from $\theta = 0$ to $\theta = (ndim2 - 1)/ndim2 * 2\pi$ where ndim2 is the number of poloidal grid points), whatever the choice of this angle is.

12.3 Numerical and computational conventions

12.3.1 Standardized Variable Types

To ensure that physics modules produce identical results on various computer architectures and to avoid issues with double precision versus single precision interfaces, the ITM-TF has agreed on a set of standardized variable types.
It is recommended that these types be used throughout all ITM modules, but at least for the interface definitions.
The Fortran90 module defining the type standards `itm_types.f90` is hosted by the project **itmshared** .
To check out the relevant files please do

```
svn checkout https://gforge6.eufus.eu/svn/itmshared/trunk/src/itm_types target_dir
```

For Fortran90, the following standard types have been defined

```
INTEGER,  PARAMETER :: ITM_I1 = SELECTED_INT_KIND (2)        ! Integer*1
INTEGER,  PARAMETER :: ITM_I2 = SELECTED_INT_KIND (4)        ! Integer*2
INTEGER,  PARAMETER :: ITM_I4 = SELECTED_INT_KIND (9)        ! Integer*4
INTEGER,  PARAMETER :: ITM_I8 = SELECTED_INT_KIND (18)       ! Integer*8
INTEGER,  PARAMETER :: R4 = SELECTED_REAL_KIND (6, 37)    ! Real*4
INTEGER,  PARAMETER :: R8 = SELECTED_REAL_KIND (15, 300) ! Real*8
```

To implement these types in your code, please add the following line to your modules

```
  use itm_types
```

Compiled versions of the module can be found in

```
  $ITMLIBDIR/itmtypes/lib/$OBJECTCODE
```

where the following values of OBJECTCODE are supported

```
amd64_g95_0.92
amd64_gfortran_4.7
amd64_intel_12
amd64_pgi_10
```

(More information about the ITM libraries (15.1).)

12.3.2 Standardized Physical Constants

To avoid discrepancies in simulations from using different definitions of the physical constants, the ITM-TF has agreed upon a set of standardized physical constants (all in SI units except for temperatures) based on the NIST recommendations [1146].
It is recommended that these constant be used throughout all ITM modules.
The Fortran90 module defining the standardized physical constants `itm_constants.f90` is hosted by the project **itmshared** .
To check out the relevant files please do

```
svn checkout https://gforge6.eufus.eu/svn/itmshared/trunk/src/itm_constants target_dir
```

Compiled versions of the module can be found in

[1146] http://physics.nist.gov/cuu/Constants/index.html

```
$ITMLIBDIR/itmconstants/lib/$OBJECTCODE
```

where the following values of OBJECTCODE are supported

```
amd64_g95_0.92
amd64_gfortran_4.7
amd64_intel_12
amd64_pgi_10
```

The C equivalent ("itm_constants.h") can be found in

```
$ITMLIBDIR/itmconstants/include/
```

and the Python in

```
$ITMLIBDIR/itmconstants/lib/python2.6/
```

A Java version is available but has not yet been released — contact ISIP if you are interested.
(More information about the ITM libraries (15.1).)
The following constants are available:

Name	Value	Description
UAL_CLOSEST_SAMPLE	1	Closest time slice
UAL_PREVIOUS_SAMPLE	2	Previous time slice
UAL_INTERPOLATION	3	Interpolation in time
ITM_INVALID_INT	-999999999	Value for invalid/uninitialized integer field
ITM_INVALID_FLOAT	-9.0e40	Value for invalid/uninitialized float field
ITM_CONSTANTS_VERSION	$Id: itm_constants.xml 2024 2015-03-24 15:22:07Z tjohnson $	

itm_constants.xml (12.3.2.1)
All constants are double precision floats (`R8`).

12.3.3 Invalid Data Base Entries

The ITM data base does not allow for setting data base entries directly to invalid in case they should not be set. Since the Universal Access Layer (UAL) (29) always pulls out complete CPOs, i.e. complete data structures, of which not all fields may be filled, the problem arose of how to identify those fields which have not been filled. In the case of arrays, this is simply done by not associating the corresponding pointer.
In the case of scalars, however, unique values for floats and integers had to be defined to identify empty fields. These values identify invalid data base entries and can be tested through comparison.
The values for invalid data base entries in Fortran90 are defined below:

```
INTEGER,  PARAMETER :: itm_int_invalid = -999999999
REAL(R8), PARAMETER :: itm_r8_invalid = -9.0D40
```

They have been found to be safely out of any physical range for the affected fields such that no accidental confusion with real values may occur.

The Fortran90 module defining these values `itm_types.f90` is hosted by the project **itmshared** .
To check out the relevant files please do

```
        svn checkout https://gforge6.eufus.eu/svn/itmshared/trunk/src/itm_types target_dir
```

The module also includes three functions of type boolean `itm_is_valid_int4` , `itm_is_valid_int8` , and `itm_is_valid_real8` which are overloaded under the interface `itm_is_valid` to check whether a data base entry has been filled.

Example:

```
if (itm_is_valid(equilibrium%global_param%i_plasma)) then

end if
```

12.3.4 Enumerated datatypes/Identifiers

This section concerns how to specify the origin of data in certain types of CPOs. The specification is performed using the datatype `identifier` . The following specifies the conventions of the allowed enumerated datatypes.

- **12.3.4.1 cocos_identifier**

```
Translation table for coordinate conventions for toroidal geometry, COCOS.

For a detailed description about the COCOS see [O. Sauter and S. Yu. Medvedev, Computer Physics C

\version "$Id: cocos_identifier.xml 2153 2019-01-31 09:23:43Z g2dpc $"
URL: https://gforge6.eufus.eu/svn/itmshared/trunk/src/itm_constants
```

Fortran interface example:

```
use cocos_identifier, only: get_type_value, get_type_name, get_type_description
```

.

Flag	Id	Description
1	COCOS_1	Coordinate specifications: (R,phi,Z) ; (rho,theta,phi); Bp = + 1/2pi grad(phi) x grad(psi) Used in e.g. psitbx, Toray-GA
2	COCOS_2	Coordinate specifications: (R,Z,phi) ; (rho,theta,phi); Bp = + 1/2pi grad(phi) x grad(psi) Used by e.g. Chease, ONETWO, Hinton-Hazeltine, LION, XTOR, MEUDAS, MARS, MARS-F
3	COCOS_3	Coordinate specifications: (R,phi,Z) ; (rho,phi,theta); Bp = - 1/2pi grad(phi) x grad(psi) Used by e.g. Freiberg, CAXE, KINX, GRAY, CQL3D, CarMa, EFIT, ORB5, GBS, GT5D
4	COCOS_4	Coordinate specifications: (R,Z,phi) ; (rho,phi,theta); Bp = - 1/2pi grad(phi) x grad(psi)
5	COCOS_5	Coordinate specifications: (R,phi,Z) ; (rho,phi,theta); Bp = + 1/2pi grad(phi) x grad(psi) Used by e.g. TORBEAM, GENRAY
6	COCOS_6	Coordinate specifications: (R,Z,phi) ; (rho,phi,theta); Bp = + 1/2pi grad(phi) x grad(psi)
7	COCOS_7	Coordinate specifications: (R,phi,Z) ; (rho,theta,phi); Bp = - 1/2pi grad(phi) x grad(psi)
8	COCOS_8	Coordinate specifications: (R,Z,phi) ; (rho,theta,phi); Bp = - 1/2pi grad(phi) x grad(psi)
11	COCOS_11	Coordinate specifications: (R,phi,Z) ; (rho,theta,phi); Bp = + grad(phi) x grad(psi). Used by e.g. ITER, Boozer
12	COCOS_12	Coordinate specifications: (R,Z,phi) ; (rho,theta,phi); Bp = + grad(phi) x grad(psi) Used by e.g. GENE
13	COCOS_13	Coordinate specifications: (R,phi,Z) ; (rho,phi,theta); Bp = - grad(phi) x grad(psi). Used by e.g. CLISTE, EQUAL, GEC, HELENA, EFDA-ITM
14	COCOS_14	Coordinate specifications: (R,Z,phi) ; (rho,phi,theta); Bp = - grad(phi) x grad(psi)
15	COCOS_15	Coordinate specifications: (R,phi,Z) ; (rho,phi,theta); Bp = + grad(phi) x grad(psi) Used by e.g. TORBEAM, GENRAY
16	COCOS_16	Coordinate specifications: (R,Z,phi) ; (rho,phi,theta); Bp = + grad(phi) x grad(psi)
17	COCOS_17	Coordinate specifications: (R,phi,Z) ; (rho,theta,phi); Bp = - grad(phi) x grad(psi). Used by e.g. LIUQE, psitbx
18	COCOS_18	Coordinate specifications: (R,Z,phi) ; (rho,theta,phi); Bp = - grad(phi) x grad(psi)

cocos_identifier.xml (12.3.4.1)

- **12.3.4.2 coordinate_identifier**

```
Translation table for coordinate_identifier_definitions.
Implemented in: utilities.xsd, complexType::weighted_markers/variable_ids

Used in:
- distribution/distri_vec/dist_func/markers/variable_ids
- distsource/source/markers/variable_ids

\version "$Id: coordinate_identifier.xml 2153 2019-01-31 09:23:43Z g2dpc $"
URL: https://gforge6.eufus.eu/svn/itmshared/trunk/src/itm_constants
```

This identifier is used in the following places in the EU-IM CPOs:

```
/distribution/distri_vec/dist_func/markers/variable_ids
```

```
/distsource/source/markers/variable_ids
```

Fortran interface example:

```
use coordinate_identifier, only: get_type_value, get_type_name, get_type_description
```

.

Flag	Id	Description
0	unspecified	unspecified

Flag	Id	Description
1	X	First cartesian coordinate in the horizontal plane [m]
2	Y	Second cartesian coordinate in the horizontal plane (grad(X) x grad(Y) = grad(Z)) [m]
4	R	Major radius [m]
5	Z	Vertical position Z [m]
6	phi	Toroidal angle [rad]
7	psi	Poloidal magnetic flux [T*m^2]
8	theta	Geometrical poloidal angle
107	rho_tor	The square root of the toroidal flux, sqrt((Phi-Phi_axis)/pi/B0) [m]
109	theta_b	Straight field line poloidal angle [rad]
110	vx	Velocity component in the x-direction [m/s]
111	vy	Velocity component in the z-direction [m/s]
112	vz	Velocity component in the z-direction [m/s]
113	vel	Magnitude of the velocity [m/s]
114	vphi	Velocity component in the toroidal direction [m/s]
115	vpar	Velocity component parallel to the magnetic field [m/s]
116	vperp	Velocity perpendicular to the magnetic field [m/s]
117	E	Hamiltonian energy [eV]
118	pphi	Canonical toroidal angular momentum [kg m**2/s]
119	mu	magnetic moment [J/T]
120	Lambda	mu/E [1/T]
121	pitch	vpar/v [1]
122	vel_thermal	Velocity normalised to the local thermal velocity of the thermal ions (of the relevant species)
123	momentum	Modulus of the relativistic momentum vector
124	parallel_momentum	Component of the relativistic momentum vector parallel to the magnetic field
125	perpendicular_momentum	Component of the relativistic momentum vector perpendicular to the magnetic field
126	xi_at_min_B	Pitch, i.e. ratio between the parallel over the perpendicular velocity, at the minimum value of the magnetic field strength along the guiding centre orbit

coordinate_identifier.xml (12.3.4.2)

- **12.3.4.3 coredelta_identifier**

```
Translation table for coredelta
Used in the cpo:
  coredelta%values(:)%deltaid

\version "$Id: coredelta_identifier.xml 2153 2019-01-31 09:23:43Z g2dpc $"
URL: https://gforge6.eufus.eu/svn/itmshared/trunk/src/itm_constants
```

This identifier is used in the following places in the EU-IM CPOs:

```
/coredelta/values/deltaid
```

Fortran interface example:

```
use coredelta_identifier, only: get_type_value, get_type_name, get_type_description
```

.

Flag	Id	Description
0	unspecified	Unspecified coredelta
1	pellet	Coredelta from a pellet
2	sawtooth	Coredelta from a sawtooth
3	elm	Coredelta from an ELM
4	combined	Combined coredelta from multiple types of events
5	not_provided	No data provided
1000	derived	Derived from another source; duplicating data

coredelta_identifier.xml (12.3.4.3)

- **12.3.4.4 coreneutral_identifier**

```
Translation table for identifying different types of neutral.
The neutrals are characterised by their energy and source of the neutrals.

\version "$Id: coreneutral_identifier.xml 2153 2019-01-31 09:23:43Z g2dpc $"
URL: https://gforge6.eufus.eu/svn/itmshared/trunk/src/itm_constants
```

This identifier is used in the following places in the EU-IM CPOs:

```
/coredelta/compositions/neutralscomp/type
```

```
/coreimpur/compositions/neutralscomp/type
```

```
/coreneutrals/compositions/neutralscomp/type
```

```
/coreneutrals/neutcompo/neutral/type
```

```
/coreprof/compositions/neutralscomp/type
```

```
/coresource/compositions/neutralscomp/type
```

```
/coretransp/compositions/neutralscomp/type
```

```
/distribution/compositions/neutralscomp/type
```

```
/distsource/compositions/neutralscomp/type
```

```
/edge/compositions/neutralscomp/type
```

```
/neoclassic/compositions/neutralscomp/type
```

```
/waves/coherentwave/compositions/neutralscomp/type
```

Fortran interface example:

```
use coreneutral_identifier, only: get_type_value, get_type_name, get_type_description
```

.

Flag	Id	Description
0	cold	Cold neutrals
1	thermal	Thermal neutrals
2	fast	Fast neutrals
3	nbi	NBI neutrals

coreneutral_identifier.xml (12.3.4.4)

- **12.3.4.5 coresource_identifier**

```
Translation table for sources of particles, momentum and heat.
Used in the cpo: coresource

\version "$Id: coresource_identifier.xml 2153 2019-01-31 09:23:43Z g2dpc $"
URL: https://gforge6.eufus.eu/svn/itmshared/trunk/src/itm_constants
```

This identifier is used in the following places in the EU-IM CPOs:

```
/coresource/values/sourceid
```

Fortran interface example:

```
use coresource_identifier, only: get_type_value, get_type_name, get_type_description
```

.

Flag	Id	Description
0	unspecified	Unspecified source type
1	nbi	Source from Neutral Beam Injection
2	ec	Sources from electron cyclotron heating heating and current drive
3	lh	Sources from lower hybrid heating and current drive
4	ic	Sources from heating at the ion cyclotron range of frequencies
5	fusion	Sources from fusion reactions, e.g. alpha particle heating
6	pellet	Sources from injection
7	ic_nbi	A combination of the ic and nbi sources
8	ic_fusion	A combination of the ic and fusion sources
9	ic_nbi_fusion	A combination of the ic and fusion sources
10	ec_lh	A combination of the ec and lh sources
11	ec_ic	A combination of the ec and ic sources
12	lh_ic	A combination of the lh and ic sources
13	ec_lh_ic	A combination of the ec, lh and ic sources
14	ohmic	Source from ohmic heating
15	brehmstrahlung	Source from bremstrahlung
16	cyclotronradiation	Source from cyclotron radiation
17	syncrotronradiation	Source from syncrotron radiation
18	cyclotron_syncrotronradiation	Source from syncrotron radiation
19	lineradiation	Source from line radiation
20	equipartition	Collisional equipartition
21	gaspuff	Gas puff
22	killergaspuff	Killer gas puff
23	ionizationlosses	Losses due to ionization
24	coldneutralcooling	Cold neutrals from the edge that enters the plasma
25	particles2wall	Particle pumping by the wall
26	particles2pump	Particle pumping by external pumps
27	database	Source from database entry
28	background	Background source
29	impurity	Impurity source
30	combined	Combined source
31	not_provided	No data provided
32	neoclassical	Neoclassical
33	gaussian	Gaussian
34	runaways	Source run-away processes; includes both electron and ion run-away
1000	unspecified_DERIVED	Derived from another source; duplicating data. Unspecified source type
1001	nbi_DERIVED	Derived from another source; duplicating data. Source from Neutral Beam Injection
1002	ec_DERIVED	Derived from another source; duplicating data. Sources from electron cyclotron heating heating and current drive
1003	lh_DERIVED	Derived from another source; duplicating data. Sources from lower hybrid heating and current drive
1004	ic_DERIVED	Derived from another source; duplicating data. Sources from heating at the ion cyclotron range of frequencies

Flag	Id	Description
1005	fusion_DERIVED	Derived from another source; duplicating data. Sources from fusion reactions, e.g. alpha particle heating
1006	pellet_DERIVED	Derived from another source; duplicating data. Sources from injection
1007	ic_nbi_DERIVED	Derived from another source; duplicating data. A combination of the ic and nbi sources
1008	ic_fusion_DERIVED	Derived from another source; duplicating data. A combination of the ic and fusion sources
1009	ic_nbi_fusion_DERIVED	Derived from another source; duplicating data. A combination of the ic and fusion sources
1010	ec_lh_DERIVED	Derived from another source; duplicating data. A combination of the ec and lh sources
1011	ec_ic_DERIVED	Derived from another source; duplicating data. A combination of the ec and ic sources
1012	lh_ic_DERIVED	Derived from another source; duplicating data. A combination of the lh and ic sources
1013	ec_lh_ic_DERIVED	Derived from another source; duplicating data. A combination of the ec, lh and ic sources
1014	ohmic_DERIVED	Derived from another source; duplicating data. Source from ohmic heating
1015	brehmstrahlung_DERIVED	Derived from another source; duplicating data. Source from bremstrahlung
1016	cyclotronradiation_DERIVED	Derived from another source; duplicating data. Source from cyclotron radiation
1017	syncrotronradiation_DERIVED	Derived from another source; duplicating data. Source from syncrotron radiation
1018	cyclotron_syncrotronradiation_DERIVED	Derived from another source; duplicating data. Source from syncrotron radiation
1019	lineradiation_DERIVED	Derived from another source; duplicating data. Source from line radiation
1020	equipartition_DERIVED	Derived from another source; duplicating data. Collisional equipartition
1021	gaspuff_DERIVED	Derived from another source; duplicating data. Gas puff
1022	killergaspuff_DERIVED	Derived from another source; duplicating data. Killer gas puff
1023	ionizationlosses_DERIVED	Derived from another source; duplicating data. Losses due to ionization
1024	coldneutralcooling_DERIVED	Derived from another source; duplicating data. Cold neutrals from the edge that enters the plasma
1025	particles2wall_DERIVED	Derived from another source; duplicating data. Particle pumping by the wall
1026	particles2pump_DERIVED	Derived from another source; duplicating data. Particle pumping by external pumps
1027	database_DERIVED	Derived from another source; duplicating data. Source from database entry
1028	background_DERIVED	Derived from another source; duplicating data. Background source
1029	impurity_DERIVED	Derived from another source; duplicating data. Impurity source
1030	combined_DERIVED	Derived from another source; duplicating data. Combined source
1031	not_provided_DERIVED	Derived from another source; duplicating data. No data provided
1032	neoclassical_DERIVED	Derived from another source; duplicating data. Neoclassical
1033	gaussian_DERIVED	Derived from another source; duplicating data. Gaussian

coresource_identifier.xml (12.3.4.5)

- **12.3.4.6 coretransp_identifier**

```
Translation table for different types of transport coefficients.

\version "$Id: coretransp_identifier.xml 2153 2019-01-31 09:23:43Z g2dpc $"
URL: https://gforge6.eufus.eu/svn/itmshared/trunk/src/itm_constants
```

This identifier is used in the following places in the EU-IM CPOs:

```
coretransp%values(:)%transportid
```

Fortran interface example:

```
use coretransp_identifier, only: get_type_value, get_type_name, get_type_description
```

.

Flag	Id	Description
0	unspecified	Unspecified transport type
1	modtransp	Derived from MODTRANSP
2	neoclassical	Neoclassical
3	turbulence_fluxtube	Turbulence / fluxtube code
4	turbulence_global	Turbulence / global code

Flag	Id	Description
5	elm_continuous	Continuous ELM model — gives the ELM averaged profile
6	elm_resolved	Time resolved ELM model
7	ntm	Transport arising from the presence of NTMs
8	sawteeth	Transport arising from the presence of sawteeth
9	pedestal	Transport level to give edge pedestal
10	database	Transport specified by a database entry
11	background	Background transport level
12	combined	Derived from a number of contributions
13	not_provided	No data provided
1000	unspecified_DERIVED	Derived from another source; duplicating data. Unspecified transport type
1001	modtransp_DERIVED	Derived from another source; duplicating data. Derived from MODTRANSP
1002	neoclassical_DERIVED	Derived from another source; duplicating data. Neoclassical
1003	turbulence_fluxtube_DERIVED	Derived from another source; duplicating data. Turbulence / fluxtube code
1004	turbulence_global_DERIVED	Derived from another source; duplicating data. Turbulence / global code
1005	elm_continuous_DERIVED	Derived from another source; duplicating data. Continuous ELM model — gives the ELM averaged profile
1006	elm_resolved_DERIVED	Derived from another source; duplicating data. Time resolved ELM model
1007	ntm_DERIVED	Derived from another source; duplicating data. Transport arising from the presence of NTMs
1008	sawteeth_DERIVED	Derived from another source; duplicating data. Transport arising from the presence of sawteeth
1009	pedestal_DERIVED	Derived from another source; duplicating data. Transport level to give edge pedestal
1010	database_DERIVED	Derived from another source; duplicating data. Transport specified by a database entry
1011	background_DERIVED	Derived from another source; duplicating data. Background transport level
1012	combined_DERIVED	Derived from another source; duplicating data. Derived from a number of contributions
1013	not_provided_DERIVED	Derived from another source; duplicating data. No data provided

coretransp_identifier.xml (12.3.4.6)

- **12.3.4.7 distsource_identifier**

```
Translation table for Heating and Current Drive (HCD) distsource types, i.e. types particles sour

Used in:
- distribution()/distri_vec()/source_id/id
- distsource()/source()/source_id/id

\version "$Id: distsource_identifier.xml 2153 2019-01-31 09:23:43Z g2dpc $"
URL: https://gforge6.eufus.eu/svn/itmshared/trunk/src/itm_constants
```

This identifier is used in the following places in the EU-IM CPOs:

```
/distsource/source/source_id
```

```
/distribution/distri_vec/source_id
```

Fortran interface example:

```
use distsource_identifier, only: get_type_value, get_type_name, get_type_description
```

.

Flag	Id	Description
0	unspecified	unspecified
1	NBI	Source from neutral beam injection
2	nuclear	Source from nuclear reaction (reaction type unspecified)
3	DT_N4He	Source from nuclear reaction: T(d,n)4He [D+T-¿He4+n]
4	D3He_P4He	Source from nuclear reaction: He3(d,p)4He [He3+D-¿He4+p]
5	DD_PT	Source from nuclear reaction: D(d,p)T [D+D-¿T+p]

Flag	Id	Description
6	DD_N3He	Source from nuclear reaction: D(d,n)3He [D+D-¿He3+n]
7	runaway	Source from runaway processes

distsource_identifier.xml (12.3.4.7)

- **12.3.4.8 fast_particle_origin_identifier**

```
Translation table for fast_particle_origin_identifier.
Used in:
- corefast/

\version "$Id: fast_particle_origin_identifier.xml 2153 2019-01-31 09:23:43Z g2dpc $"
URL: https://gforge6.eufus.eu/svn/itmshared/trunk/src/itm_constants
```

This identifier is used in the following places in the EU-IM CPOs:

```
/corefast/values/fastid
```

Fortran interface example:

```
use fast_particle_origin_identifier, only: get_type_value, get_type_name, get_type_description
```

.

Flag	Id	Description
0	unspecified	unspecified
1	NBI	From NBI heating
2	IC	Accelerated by IC waves
3	EC	Accelerated by EC waves
4	LC	Accelerated by LH waves
5	alpha	Fusion product alpha particle
6	fusion	Fusion product
7	run_away	Run-away acceleration
8	knock_on	Generated by a knock-on collision with a fast particle
9	combined	Combination of fast particles from several sources

fast_particle_origin_identifier.xml (12.3.4.8)

- **12.3.4.9 fast_thermal_filter_identifier**

```
Translation table for fast_thermal_separation_filter_identifier_definition.
Implemented in: utilities.xsd, complexType::fast_thermal_separation_filter/method

\version "$Id: fast_thermal_filter_identifier.xml 2153 2019-01-31 09:23:43Z g2dpc $"
URL: https://gforge6.eufus.eu/svn/itmshared/trunk/src/itm_constants
```

This identifier is used in the following places in the EU-IM CPOs:

```
/corefast/values/filter/method
```

```
/distribution/distri_vec/fast_filter/method
```

Fortran interface example:

```
use fast_thermal_filter_identifier, only: get_type_value, get_type_name, get_type_description
```

Flag	Id	Description
0	unspecified	unspecified
1	EnergyCutOff	The fast-thermal separation is performed at an given value of particle kinetic energy.
2	EnergyTiCutOff	The fast-thermal separation is performed at an given ratio between the particle kinetic energy and the local thermal ion energy.
3	EnergyTeCutOff	The fast-thermal separation is performed at an given ratio between the particle kinetic energy and the local thermal electron energy.
4	delta_f	The fast particle population is the different between the full population and a thermal Maxwellian.

fast_thermal_filter_identifier.xml (12.3.4.9)

- **12.3.4.10 fokker_planck_source_identifier**

```
Translation table for fokker_planck_source_identifier.
Implemented in: distribution.xsd, complexType::dist_sources_reference/type

Note that the type definitions are not necessarily disjoints sets.
For example wall-firstorbit and wall-coulomb are both subsets of wall.
When describing a wall loss one should always aim to use the most detailed
type available. While when finding all wall losses one has to sum over all
three types: wall, wall-firstorbit and wall-coulomb.

\version "$Id: fokker_planck_source_identifier.xml 2153 2019-01-31 09:23:43Z g2dpc $"
URL: https://gforge6.eufus.eu/svn/itmshared/trunk/src/itm_constants
```

This identifier is used in the following places in the EU-IM CPOs:

```
/distribution/distri_vec/global_param/sources/source_ref/type
```

```
/distribution/distri_vec/profiles_1d/sources/source_ref/type
```

Fortran interface example:

```
use fokker_planck_source_identifier, only: get_type_value, get_type_name, get_type_description
```

.

Flag	Id	Description
0	unspecified	unspecified
1	wave	Source/sink from a waves CPO
2	distsource	Source/sink from a distsource CPO
3	wave_and_source	Source/sink from both the waves and the distsource CPOs
4	thermal	Artificial source/sink used to represent transport processes
5	wall	Source/sink from the wall
6	wall_firstorbit	Collisionless wall losses during first orbit from birth
7	wall_coulomb	Wall losses caused by Coloumb collisions
8	atomic	Source/sink due to atomic processes, e.g. CX reactions
9	nuclear	Source/sink due to nuclear reactions

fokker_planck_source_identifier.xml (12.3.4.10)

- **12.3.4.11 pellet_shape_identifier**

```
Translation table for pellet_shape_identifier_definition.
Used in:
- pellet/
```

```
\version "$Id: pellet_shape_identifier.xml 2153 2019-01-31 09:23:43Z g2dpc $"
URL: https://gforge6.eufus.eu/svn/itmshared/trunk/src/itm_constants
```

This identifier is used in the following places in the EU-IM CPOs:

```
/pellet/shape/type
```

Fortran interface example:

```
use pellet_shape_identifier, only: get_type_value, get_type_name, get_type_description
```

.

Flag	Id	Description
0	unspecified	unspecified
1	rectangular	Rectangular pellet. Here dimensions(1) is the height [m], dimensions(2) is the width [m] and dimensions(3) is the length [m] of the rectangle.
2	cylindrical	Cylindrical pellet Here dimensions(1) is the radius [m] and dimensions(2) is the height [m] of the cylinder.
3	spherical	Spherical pellet. Here dimensions(1) is the radius [m] of the sphere.

pellet_shape_identifier.xml (12.3.4.11)

- **12.3.4.12 species_reference_identifier**

```
Translation table for species_reference_identifier_definition.
Implemented in:
- utilities.xsd: complexType species_reference

\version "$Id: species_reference_identifier.xml 2153 2019-01-31 09:23:43Z g2dpc $"
URL: https://gforge6.eufus.eu/svn/itmshared/trunk/src/itm_constants
```

This identifier is used in the following places in the EU-IM CPOs:

```
/distribution/distri_vec/species/type
```

```
/distsource/source/species/type
```

Fortran interface example:

```
use species_reference_identifier, only: get_type_value, get_type_name, get_type_description
```

.

Flag	Id	Description
0	unspecified	unspecified
1	electron	Electron
2	ion	Ion from compositions/ions
3	impurity	Impurity from compositions/impur
4	neutron	Neutron
5	photon	Photon
6	neutral	Neutral particle, e.g. atom or molecule from charge exchange reactions

species_reference_identifier.xml (12.3.4.12)

- **12.3.4.13 wall_identifier**

```
Translation table for wall_identifier_defintions.

Used in:
- wall cpo

\version "$Id: wall_identifier.xml 2153 2019-01-31 09:23:43Z g2dpc $"
URL: https://gforge6.eufus.eu/svn/itmshared/trunk/src/itm_constants
```

This identifier is used in the following places in the EU-IM CPOs:

```
/wall/wall2d/wall_id
```

```
/wall/wall3d/wall_id
```

Fortran interface example:

```
use wall_identifier, only: get_type_value, get_type_name, get_type_description
```

.

Flag	Id	Description
0	unspecified	unspecified
1	equilibrium	Equilibrium wall
2	gas_tight	Gas tight wall
3	FBE	Free boundary equilibrium wall
4	RWM	3D RWM wall (with holes)

wall_identifier.xml (12.3.4.13)

- **12.3.4.14 wave_identifier**

```
Translation table for wave field types.
Used in:
- distribution()/distri_vec()/waves_id/id
- waves()/coherentwave()/waves_id/id

\version "$Id: wave_identifier.xml 2153 2019-01-31 09:23:43Z g2dpc $"
URL: https://gforge6.eufus.eu/svn/itmshared/trunk/src/itm_constants
```

This identifier is used in the following places in the EU-IM CPOs:

```
/waves/coherentwave/wave_id
```

```
/distribution/distri_vec/wave_id
```

Fortran interface example:

```
use wave_identifier, only: get_type_value, get_type_name, get_type_description
```

.

Flag	Id	Description
0	unspecified	unspecified
1	EC	Wave field for electron cyclotron heating and current drive
2	LH	Wave field for lower hybrid heating and current drive
3	IC	Wave field for ion cyclotron frequency heating and current drive

wave_identifier.xml (12.3.4.14)

Compiled versions of the modules can be found in

```
$ITMLIBDIR/itmconstants/lib/$OBJECTCODE
```

where the following values of OBJECTCODE are supported

```
amd64_g95_0.92
amd64_gfortran_4.7
amd64_intel_12
amd64_pgi_10
```

The C equivalent can be found in

```
$ITMLIBDIR/itmconstants/include/
```

and the Python in

```
$ITMLIBDIR/itmconstants/lib/python2.6/
```

A Java version is available but has not yet been released — contact the CPT if you are interested.
(More information about the ITM libraries (15.1).)

12.3.4.15 Example: How to fill coresource/values/sourceid

When filling in an enumerated datatype, like `coresource/values/sourceid` , it is recomended to use the parameters and functions built into the fortran modules associated with each such datatype. These modules are available as part of the UAL package. As an examples we may include the `coresource_identifier` :

```
use coresource_identifier, only: fusion, get_type_name, get_type_description__ind
```

Here the value of the integer-parameter `fusion` is the `Flag` for fusion reactions in the `coresource_identifier` (12.3.4.5) structure (i.e. fusion=5). Once we know the `Flag` we may get the `Id` using the function `Id=get_type_name(Flag)` and the `Description` using the function `Description=get_type_description__ind(Flag)` . These function are available for every datatype.

Below you have an example of how to use these functions:

```
program coresource_example
  use euitm_schemas, only: type_coresource
  use coresource_identifier, only: fusion, get_type_name, get_type_description__ind
  use write_structures, only: open_write_file, write_cpo, close_write_file
  use deallocate_structures, only: deallocate_cpo
  implicit none

  type (type_coresource) :: coresource
  integer :: idx, i

  character*128 :: filename
  integer :: shot, run

  data filename / &
       & 'coresource.cpo' &
       & /
```

```
  allocate(coresource%values(1))
  allocate(coresource%values(1)%sourceid%id(1))
  allocate(coresource%values(1)%sourceid%description(1))
  coresource%values(1)%sourceid%flag = fusion
  coresource%values(1)%sourceid%id = get_type_name(fusion)
  coresource%values(1)%sourceid%description = get_type_description__ind(fusion)

  call open_write_file(1, filename)
  call write_cpo(coresource, 'coresource')
  call close_write_file

  call deallocate_cpo(coresource)

end program coresource_example
```

This example program, and similar examples for other enumerated datatypes, are available in:

```
https://gforge6.eufus.eu/svn/itmshared/trunk/src/itm_constants/examples
```

12.3.5 Grid Types in Equilibrium CPO

Equilibria may be represented in a variety of different ways depending on which ITM module has calculated them and which module shall use them. To avoid ambiguity and to allow modules to check which type of equilibrium is stored in the equilibrium CPO, a unique grid identifier is stored in profiles_2d%grid_type.
The grid identified currently consists of 4 strings (at 132 chars) with the following structure (array indices in Fortran notation):

Position	Content
grid_type(1)	integer identifier for grid type
grid_type(2)	string identifier for grid type
grid_type(3)	integer identifier for poloidal angle
grid_type(4)	string identifier for poloidal angle

12.3.5.1 Grid Type Identifier

The currently allowed values (integer and string) for the identifier of the grid type are listed below:

Integer Values	String Value	Description
1	rectangular	Regular grid in (R, Z) .'EFIT-like grid'.
2	inverse	Regular grid in (Ψ, θ) .'flux surface grid'.
3	irregular	Irregular grid. All fields in profiles_2d are given as (ndim1, 1) degenerate 2D matrices, i.e. as lists of vertices (for triangles or quadrilaterals).

12.3.5.2 Poloidal Angle Identifier

The currently allowed values (integer and string) for the identifier of the poloidal angle are listed below:

Integer Values	String Value	Description
1	straight field line	straight field line angle θ as defined in Straight Field Line Coordinates [1147]
2	equal arc	Poloidal angle θ defined by equal arc lengths along flux surfaces
3	polar	Poloidal angle θ in toroidal coordinates as defined in Coordinate System (12.2.1)

[1147] https://www.efda-itm.eu/ITM/html/.html#itm_straight_field_line

12.3.6 Standardized EU-ITM Plasma Bundle

The ITM has agreed on a standardized way to bundle CPOs and control parameters inside KEPLER.

Field names			Type	Description
time			`real`	The synthetic time of the simulation, or for time-dependent workflows; the end of the present time step. For example, consider a time dependent workflows, where physics quantities are update one after the other. Thus, while the physics quantities are updated the various fields below (e.g. the CPOs) may be describe at different time points. In such workflows the this "time"-field describe the time at the end of the present time step. Units: (s)
CONTROL	tau		`real`	time-step (s)
	tau_out		`real`	time interval for saving output (s)
	ETS	amix	`real`	mixing factor
		amix_tr	`real`	mixing factor for profiles
		sigma_source	`integer`	option for origin of plasma electrical conductivity: 0: plasma collisions; 1: transport module; 2: source module
		solver_type	`integer`	choice of numerical solver
		conv_rec	`real`	required fractional convergence
CPOS	MHD	equilibrium	`cpo`	see type (7.9.3.1.32) and fortran (7.9.3.2.15) descriptions
		toroidfield	`cpo`	see type (7.9.3.1.52) and fortran (7.9.3.2.35) descriptions
		mhd	`cpo`	see type (7.9.3.1.40) and fortran (7.9.3.2.23) descriptions
		sawteeth	`cpo`	see type [1148] and fortran [1149] descriptions
	CORE	coreprof	`cpo`	see type (7.9.3.1.24) and fortran (7.9.3.2.7) descriptions
		coretransp	`cpo`	see type (7.9.3.1.26) and fortran (7.9.3.2.9) descriptions
		coresource	`cpo`	see type (7.9.3.1.25) and fortran (7.9.3.2.8) descriptions
		coreimpur	`cpo`	see type (7.9.3.1.22) and fortran (7.9.3.2.5) descriptions
		coreneutral	`cpo`	see type [1150] and fortran [1151] descriptions
		corefast	`cpo`	see type [1152] and fortran [1153] descriptions
		coredelta	`cpo`	see type (7.9.3.1.21) and fortran (7.9.3.2.4) descriptions
		compositionc	`cpo`	see type [1154] and fortran [1155] descriptions
		neoclassic	`cpo`	see type (7.9.3.1.43) and fortran (7.9.3.2.26) descriptions
	EDGE	edge	`cpo`	see type (7.9.3.1.31) and fortran (7.9.3.2.14) descriptions
	HCD	waves	`cpo`	see type (7.9.3.1.56) and fortran (7.9.3.2.39) descriptions
		distsource	`cpo`	see type (7.9.3.1.29) and fortran (7.9.3.2.12) descriptions
		distribution	`cpo`	see type (7.9.3.1.28) and fortran (7.9.3.2.11) descriptions
	MACH	vessel	`cpo`	see type (7.9.3.1.55) and fortran (7.9.3.2.38) descriptions
		wall	`cpo`	see type [1156] and fortran [1157] descriptions
		nbi	`cpo`	see type (7.9.3.1.42) and fortran (7.9.3.2.25) descriptions
		antennas	`cpo`	see type (7.9.3.1.20) and fortran (7.9.3.2.3) descriptions
		ironmodel	`cpo`	see type (7.9.3.1.35) and fortran (7.9.3.2.18) descriptions
		pfsystems	`cpo`	see type (7.9.3.1.45) and fortran (7.9.3.2.28) descriptions
	DIAG	fusiondiag	`cpo`	see type (7.9.3.1.33) and fortran (7.9.3.2.16) descriptions
		scenario	`cpo`	see type (7.9.3.1.49) and fortran (7.9.3.2.32) descriptions
	EVENTS	pellets	`cpo`	see type [1158] and fortran [1159] descriptions
PCS	input		pcs_in	Diagnostics input signals to the plasma control system (see comple-type definition below)
	reference		pcs_ref	Reference signals for the plasma control system (see comple-type definition below)
	output		pcs_out	Output signals from plasma control system (see comple-type definition below)

[1159] https://www.efda-itm.eu/ITM/html/.html#pellets_Fortran

The complex-types used in the PCS.

Field names	Type	Description
pcs_in (under development)		**Diagnostics for plasma control**
pcs.inputs.plasma_variables	type_plasma_ variables	Plasma variables
pcs.inputs.plant_variables	type_plant_ variables	Plant variables
pcs_ref (under development)		**Reference signals for plasma control**
pcs.reference.plant_variables	type_plant _variables	Plant variables
pcs.reference.plant_configuration	type_plant _configuration	Plant configuration
pcs_out (under development)		**Output signal for plasma control**
pcs.output.plasma_variables	type_plasma _variables	Plasma variables
pcs.output.plant_variables	type_plant _variables	Plant variables. NOTE: only for artificial control.
type_plasma_variables (under development)		**Plasma properties relevant for plasma control**
plasma.shape.ZIP	float	Z_centre*Ip (used for vertical control; definition of Z_centre can vary) [Am]
plasma.shape.gaps(:)	float	Distance between the plasma and the wall components [m]
plasma.magnetics.b_toroidal	real	Toroidal magnetic field at the magnetic axis [T]
plasma.magnetics.Ip	real	Current (A) CPO element: equilibrium().global_param.current_tot
plasma.magnetics.v_loop	real	Loop voltage (V) CPO element: coreprof().profiles1d.vloop.value
plasma.confinement.ne_line_integrated	real	Line integrated electron density (m^{-2})
plasma.confinement.beta_toroidal	real	Toroidal beta CPO element: equilibrium().global_param.beta_tor
plant_variables (under development)		**Plant variabels**
pf_system...	-	-
plant_variables.fuelling.pellet.trigger	integer	TRUE if pellet is being launched, othervise FALSE
plant_variables.fuelling.gas.puff_rate	real	Gas puffing rate (1/s)
plant_variables.hcd.nbi.power	real	NBI power (W) CPO element: nbi().nbi_unit().pow_unit.value
plant_variables.hcd.nbi.injection_angle	real	NBI launching angle (rad) CPO element: nbi().nbi_unit().pow_unit.value
plant_variables.hcd.ec.power	real	EC power (W) CPO element: antennas().antenna_unit().antenna_ec.power.value
plant_variables.hcd.ec.angle	real	EC launch angle (definition depend on the machine) [rad]
plant_variables.hcd.lh.power	real	LH power (W) CPO element: antennas().antenna_unit().antenna_lh.power.value
plant_variables.hcd.lh.n_parallel	real	Parallel refractive index [1]
plant_variables.hcd.ic.power	real	IC power (W) CPO element: antennas().antenna_unit().antenna_ic.power.value
plant_variables.hcd.ic.frequency	real	RF wave frequency (Hz) CPO element: antennas().antenna_unit().antenna_ic.freq

last update: 2019-01-31 by g2dpc

13 HowTo's

This section is intended to host useful material on how to solve everyday problems when dealing with ITM tools both as a developer and as a user. The material is presented in an instructive way via tutorials, HowTo's, and user guides.

13.1 How to adapt your code to ITM platform (Quick Start).

This is a fast manual on the steps needed to adapt the stand alone version of a code to be used as an actor inside a KEPLER workflow .
Please do not get discouraged but rather contact denis.kalupin@efda.org for help.

13.2 How to contribute to the ITM documentation websites.

Your contribution to the ITM documentation websites is very welcome.

To be able to contribute to the ITM websites you must be a member of the documentation project

```
doc_test
```

under Gforge (29) on the ITM Gateway (29) (see How to become a member of a Gforge project (13.8)).

After having joined the project please check out a working copy of the repository:

```
svn co https://gforge6.eufus.eu/svn/doc_test/trunk target_dir
```

where target_dir is a directory name of your choice (it will be created by svn in your current directory)

The trunk/ of the repository has the following structure which reflects the project structure of the ITM:

```
- world
- itm
- isip
- amns
- edrg
- imp12
- imp3
- imp4
- imp5
```

Material in `world` will be visible on the web server to the whole world while access to the material in all other projects is limited to ITM members via login.

Each project has two subdirectories

```
- private
- public
```

Material placed into **private** will only be visible to members of the same project whereas material in **public** is visible to the entire ITM-TF.
Inside `public` you find the following structure:

```
- graphics
- html
- imports
```

```
- pdf
- xml
```

The `graphics` directory is intended to host all graphics files whereas the `imports` directory shall host all other file types except for the xml and html files used for the generation of the ITM web pages. Those shall be placed into the `xml` and `html` directories. The `pdf` directory is used for processing only. Please do not place any files there.
Currently you are not allowed to created any subdirectories under the `graphics` directory and files there have to follow a naming convention. You may, however, create any structure of subdirectories under the `imports` directory and files there may have any name.

To contribute material to the ITM web pages you have two options:

```
- XML
- HTML
```

The recommended way of contributing is in the form of XML documents following the DocBook format. The ITM-TF currently uses a publishing tool created by John Storrs which allows the automatic conversion of DocBook like XML documents into HTML. This method has various advantages among which the most pronounced are that the contributor will not have to worry about the style and the overall structure of the web pages but rather contribute his/her material in the form of simple DocBook elements. The publication tools will then convert the existing material into a hierarchical and searchable structure of web pages with a single layout.
The current publishing tool PracticalXML allows only a small subset of the large variety of DocBook elements. For information about Docbook, including online books, visit the 'official home page' [1160]. For the full DocBook tagset, see DocBook: The Definitive Guide [1161]. Some extensions based on HTML have been added for highlighting and structuring of the web pages. If there is need for extensions, they may be implemented by extending PracticalXML. Please contact John Storrs or Christian Konz if you are missing fundamental functionalities.

A short introduction to using PracticalXML can be found following the How to write documents for Practical XML (13.3) link.

Alternatively or in addition you may place directly designed HTML pages in the html directory of your project. This allows you to use the full scope of HTML elements and your own style sheet (though not recommended) but has the drawback that your pages will not be searchable nor included in the overall structure.

Writing your web pages in XML will allow them to be included in the automatic creation of hierarchical book-like pdf's of the web pages.

Therefore, please give DocBook XML a try. It is easy to learn and to use.

To avoid name clashes, you will have to adopt the following **convention on file names in the `graphics` directory and Id's** :

All names of the files in the graphics/ and html/ directories **must** start with the name of the project plus an underscore, for instance "imp12_graphic.png" instead of "image.png". Furthermore, the Id names of the xml files which you find in the 'section class' element must likewise start with the name of the project plus underscore, for instance `<section class="topic" id="itm_practicalxml">` .

This will make sure that your documents will not be overwritten by documents with identical names.

All **links to files** must be **relative** .
There are two types of links to files:

[1160] http://www.docbook.org
[1161] http://www.docbook.org/tdg/en/html/docbook.html

- links to **xml files** in `<include file= ... >` tags: These must be relative to the `itm/public/xml` directory, e.g. `<include file="../../../itm/public/xml/itm_howtos.xml">`.
- links to **files in** `imports/` in `<ulink url=... >` tags: These must be relative to the `html` directory of the web server, e.g. `<ulink url="../imports/meetings/2009/EDRG_kickoff/edrg_kick-off.ppt">`

Automatic PDF Generation:
For web pages developed in XML, you have the option to automatically generate a pdf version of your web page. The tools of PracticalXML will convert the specified xml document into pdf and also decend into depending xml documents. The result is an article like document with table of contents and hyperlinks.
To tell the system to automatically generate a pdf version of a web page you need to include the `pdf attribute` in the top section of your xml document.

Example:

```
<section class="topic" id="itm_howtos" pdf="itm_howtos">
```

The value of the pdf tag has to be identical to the value of the id tag and the name of the xml file, in the example above: itm_howtos.xml.

The system will then automatically generate a pdf version of the web page and place it into the `pdf/` directory, in the example as `itm_howtos.pdf`. It will also generate the pdf link symbol ⇒ **pdf** at the top of the page which links directly to the pdf document.

Automatic Update Information:
Using the **svn keyword Id** it is possible to generate an automatic update information for each xml document. For this, you have to add the following line

```
<timestamp>version: $Id: itm_howtos.xml 2153 2019-01-31 09:23:43Z g2dpc $</timestamp>
```

at the bottom of your xml document just before closing the last section tag. Furthermore, you have to set **svn:keywords** to **Id**. This can be done with

```
svn ps svn:keywords Id example.xml
```

assuming your xml is stored in "example.xml". With each commit, svn will automatically add the commit information between the two '$' which will be processed into the required update information by the system.

Once you have committed your changes, a (soon) automatic make process will update the ITM web pages with your changes and place them on the web server. It will also automatically generate pdf's of all web pages. A link to the pdf is shown at the top of the web pages. The date and author of the last updates is shown at the bottom of the pages.

13.2.1 PracticalXML Testbed

To allow for an easy and decoupled development of the XML web pages of each project (which will later be linked to the entire website by a cron job) we have developed a test bed environment. Please use this environment to generate your web pages before committing an XML file to the trunk/ directory.

The idea here is that you can generate the corresponding html version independently of the rest of the web pages. This allows you to debug and polish your XML files before committing them to the trunk.

Here is what you need to do for that:

1.) First check out a working copy of the test bed `doc_test/branches`:

```
svn checkout https://gforge6.eufus.eu/svn/doc_test/branches target_dir
```

This will create a local copy of the software `publishxml` in your working copy and a binary version of `tex2im` which should run on all linux platforms.

To include `tex2im` in your path please do the following

```
setenv PATH {$PATH}:path_to_target_dir/tex2im-1.8
```

or equivalent (depending on the shell) where `path_to_target_dir` is the path to your working copy.

2.) Inside the test bed check out a working copy of your project's web pages (here for ISIP as an example):

```
svn checkout https://gforge6.eufus.eu/svn/doc_test/trunk/isip isip
```

This will strongly reduce the size of your working copy and allow you to edit you project's web pages without worrying about the rest of the website.
If you require access to the rest of the website consider checking out additional working copies of separate projects just like your own.

3.) Edit your web pages inside your working copy of your project, i.e.

```
cd isip/public/xml

edit xml files

cd ../../ (i.e. inside isip/)

svn commit -m "- made some changes"  (just an example)
```

IMPORTANT: Commit your changes from within the working copy of your project (i.e. `isip`), NOT from the working copy of the test bed (i.e. `doc_branches`) - else nothing will happen.

4.) Make your web pages:

```
cd isip/public/xml

./makehtml.sh main.xml
```

This will create the corresponding html files in `isip/public/html/` and a symbolic link in `isip/public/imports/` .
If there are errors in your xml files, you will see the error messages here.
If you like to make a single web page, do

```
./makehtml.sh <filename>
```

where `<filename>` is the name of your xml document.

5.) Inspect your web pages:

```
firefox isip/public/html/index.html
```

The layout is as it will appear on the server.

Please be aware that the test bed does NOT allow you to upload material to the web server yourself. This is done automatically by a CRON job.

For inspiration on which elements are available in PracticalXML please consider the example document `test.xml` in the `xml` directory of the test bed.

Dependencies:
We assume that you have the following software installed on your system:

```
- perl
- python
- latex
- pdflatex
- convert
```

All these are needed to make the web pages.

13.3 How to write documents for Practical XML

13.3.1 Introduction

This is the ITM-TF version of a public domain xml processing package written by **John Storrs** . It aims to promote the wider use of xml for information capture and documentation. The ITM-TF has adopted this package for the publication of its websites. The package contains an xml parser, documentation generator, dtd generator, xml validator, with sample applications and associated xml documents. The applications include a simple tutorial which shows how easy it is to build and process an in-memory tree representing an xml document.

xml is a curate's egg of a standard, and the Practical XML project currently only handles the good bits. It focuses on the definition of hierarchical data structures using element and attribute markup. It handles the insertion of standard entities, but not user-defined entity definitions. Though it only covers a subset of the xml standard, the Practical XML package is useful in a wide range of applications.

The project software is written in Perl, an ideal language for text processing. The parser and system tools make extensive use of Perl regular expressions and other useful features of the language.

The package files are organised in 2 subdirectories: *lib* , containing the parser libraries, *app* containing system and demo applications.

13.3.2 Use

To use the **Practical XML parser** or applications on the ITM Gateway (29) you need to set an environment variable `PXML_HOME` to point to `${SWITMDIR}/pracxml/app/publishxml` . You also need to add `konz/public/tex2im-1.8` to your path, for `tex2im` . Perl 5.8 or later is required. The pdf generator uses Latex as its output engine, so one of the current Tex/Latex packages is needed. The ImageMagick convert-6.0.0 or higher is needed for graphics conversion, and the graphviz package is used in a DocBook extension. The software tool requirements should be satisfied by any recent Linux distribution. Once you are set up you should be able to process Practical XML documents by running make in the `itm/public/xml` subdirectory. The results are placed in the html and pdf subdirectories.

Alternatively, you may set up your own personal testbed for PracticalXML (see PracticalXML Testbed (13.2.1)). This allows you to develop and process xml based web pages and pdf documents on most Linux and Unix system. For more information see How to contribute to the ITM documentation websites (13.2).

13.3.3 Parser

The xml parser is in two perl modules: `lib/LME/Xmlparser.pm` and `lib/LME/XmlNode.pm` . It is an incremental parser, allowing memory-efficient processing of large xml files.

13.3.4 Applications

The `app` subdirectory contains system tools `publishxml` , `generatedtd` and `validatedtd` , some demo applications process*, and a coding tutorial. Example xml documents processed by the demo applications are in the `doc` subdirectory.

13.3.4.1 publishxml

This is a documentation generator for a core subset of DocBook, with some useful extensions. It currently generates html and pdf output. It has a clean, **extensible** design, and is much faster than some other open source Docbook tools.

13.3.4.2 generatedtd

This generates a dtd from a collection of xml documents expressing a single schema.

13.3.4.3 validatexml

This validates an xml document against a dtd.

13.3.4.4 processtopics

`processjournal` , `processtasks` and `processrecords` are topic-based applications illustrating the transformation of a user-defined xml vocabulary to DocBook. A topic tree is defined using a simple xml vocabulary. This can be processed by processtopics to generate topic tree documentation. Other documents can structure their contents implicitly by reference to this tree.

13.3.4.5 processjournal

This processes a topic-based journal written in a simple vocabulary with embedded DocBook.

13.3.4.6 processrecords

This processes a topic-based structured document written in a simple vocabulary with embedded DocBook. PDF output is generated recursively for all levels in the topic hierarchy, making it easy to view any sub-tree of the document

13.3.4.7 processtasks

This processes a topic-based project task description, generating project management documentation.

13.3.4.8 tutorial1

This shows how easy it is to build and process an in-memory tree representation of an xml file. Try it with your own application-specific vocabulary.

13.3.5 DocBook

This document is an example of a Docbook *article* , which uses *sections* to structure its contents. Alternatively, the top level element could be a *book* . Books contain chapters, which in turn contain sections as shown here. You can organise document content in multiple files, using the *include* tag extension.

For information about Docbook, including online books, visit the 'official home page' [1162]. For the full DocBook tagset, see DocBook: The Definitive Guide [1163]. As you can see, DocBook is very big, with many specialised tags. PracticalXML covers only the commonly used features.

13.3.5.1 Sections

```
<section id="sectionId">
  <title>Section Title</title>
  <!-- section content comes here -->
</section>
```

[1162] http://www.docbook.org
[1163] http://www.docbook.org/tdg/en/html/docbook.html

Note the xml comment tags. The section *id* attribute is optional. You can use it on any tag to provide a target for an internal link. Id attributes must be unique in a document. See Links (13.3.5.6) below.

You can nest sections. There are tags to support nesting (*sect1* , *sect2* , *sect3* , etc), but they offer no advantage over plain *section* .

There are two special **classes** of the <section> element which have to be used as the outermost element when defining a new XML file.

1. **class="topic"** : This section class defines a new html page. It also creates a section in the pdf version. Therefore, please complete it with a <title> element.

2. **class="import"** : This section class defines a mere import of the enclosed xml without the creation of a new html page. This is especially useful when the XML material shall be used in various locations of the website. No explicit section is created in the pdf version. A title element is therefore not required.

13.3.5.2 Paragraphs

```
<para>Paragraph 1 content.</para>
<para>Paragraph 2 content.</para>
```

Paragraph 1 content.

Paragraph 2 content.

13.3.5.3 Lists

Itemized (bullet) list:

```
<itemizedlist>
  <listitem>First item content.</listitem>
  <listitem>Second item content.</listitem>
</itemizedlist>
```

- First item content.
- Second item content.

Ordered (numbered) list:

```
<orderedlist>
  <listitem>First item content.</listitem>
  <listitem>Second item content.</listitem>
</orderedlist>
```

1. First item content.
2. Second item content.

Lists can be nested.

13.3.5.4 Tables

Table with title:

```
<table frame="sides">
  <title>Table Title</title>
  <tgroup cols="2">
    <colspec colwidth="30mm"/>
    <colspec colwidth="30mm"/>
```

```
    <thead>
      <row>
        <entry>column1 title</entry>
        <entry>column2 title</entry>
      </row>
    </thead>
    <tbody>
      <row>
        <entry>row1 column1 content</entry>
        <entry>row1 column2 content</entry>
      </row>
      <row>
        <entry>row2 column1 content</entry>
        <entry>row2 column2 content</entry>
      </row>
    </tbody>
  </tgroup>
</table>
```

Table 4790: Table Title

column1 title	**column2 title**
row1 column1 content	row1 column2 content
row2 column1 content	row2 column2 content

The table above was generated without the top and bottom lines using the `frame` attribute (here set to "sides"). The allowed values for this attribute are `all`, `bottom`, `none`, `sides`, `top` and `topbot` following the DocBook definitions.

Complex table with multicolumn and multirow spans:

```
<informaltable frame="all">
  <tgroup cols="4">
    <colspec colnum="1" colname="c1" colwidth="30mm"/>
    <colspec colnum="2" colname="c2" colwidth="30mm"/>
    <colspec colnum="3" colname="c3" colwidth="30mm"/>
    <colspec colnum="4" colname="c4" colwidth="30mm"/>
    <thead>
      <row>
        <entry morerows="1">header multirow1</entry>
        <entry morerows="1">header multirow2</entry>
        <entry namest="c3" nameend="c4">header multicolumn</entry>
      </row>
      <row>
         <entry colname="c3">subcolumn1</entry>
         <entry colname="c4">subcolumn2</entry>
      </row>
    </thead>
    <tbody>
      <row>
         <entry morerows="2">body multirows</entry>
         <entry>body column2</entry>
         <entry morerows="1">body multirows</entry>
         <entry>body column4</entry>
      </row>
      <row>
         <entry>body column2</entry>
         <entry>body column4</entry>
      </row>
      <row>
```

```
        <entry namest="c2" nameend="c4">body multicolumn</entry>
      </row>
    </tbody>
  </tgroup>
</informaltable>
```

<table>
<thead>
<tr><th rowspan="2">header multirow1</th><th rowspan="2">header multirow2</th><th colspan="2">header multicolumn</th></tr>
<tr><th>subcolumn1</th><th>subcolumn2</th></tr>
</thead>
<tbody>
<tr><td rowspan="3">body multirows</td><td>body column2</td><td rowspan="2">body multirows</td><td>body column4</td></tr>
<tr><td>body column2</td><td>body column4</td></tr>
<tr><td colspan="3">body multicolumn</td></tr>
</tbody>
</table>

For a table without a title, use *informaltable* which is otherwise the same. Specify column widths in mm. For more information on tables in DocBook please consult DocBook XSL: The Complete Guide [1164].

Table with rows with alternating colours but without lines:

```
<table alternating="yes" rules="none">
  <title>Alternating Table</title>
  <tgroup cols="2">
    <colspec colwidth="60mm"/>
    <colspec colwidth="60mm"/>
    <thead>
      <row>
        <entry>column1 title</entry>
        <entry>column2 title</entry>
      </row>
    </thead>
    <tbody>
      <row>
        <entry>row1 column1 content</entry>
        <entry>row1 column2 content</entry>
      </row>
      <row>
        <entry>row2 column1 content</entry>
        <entry>row2 column2 content</entry>
      </row>
      <row>
        <entry>row3 column1 content</entry>
        <entry>row3 column2 content</entry>
      </row>
      <row>
        <entry>row4 column1 content</entry>
        <entry>row4 column2 content</entry>
      </row>
      <row>
        <entry>row5 column1 content</entry>
        <entry>row5 column2 content</entry>
      </row>
      <row>
        <entry>row6 column1 content</entry>
        <entry>row6 column2 content</entry>
      </row>
    </tbody>
  </tgroup>
</table>
```

[1164] http://www.sagehill.net/docbookxsl/

Table 4792: Alternating Table

column1 title	column2 title
row1 column1 content	row1 column2 content
row2 column1 content	row2 column2 content
row3 column1 content	row3 column2 content
row4 column1 content	row4 column2 content
row5 column1 content	row5 column2 content
row6 column1 content	row6 column2 content

For a table without internal lines set the `rules` attribute to "none". If not set, the attribute defaults to "all" which draws all internal lines. **Do not use `rules="none"` together with multicolumns or multirows!** To build a table with alternating row colours set the attribute `alternating` to "yes". Leaving out this attribute or setting it to any other value will produce a table without row colours.

13.3.5.5 Graphics

```
<graphic fileref="../graphics/itm_viewlog1.png" width="70%"/>
```

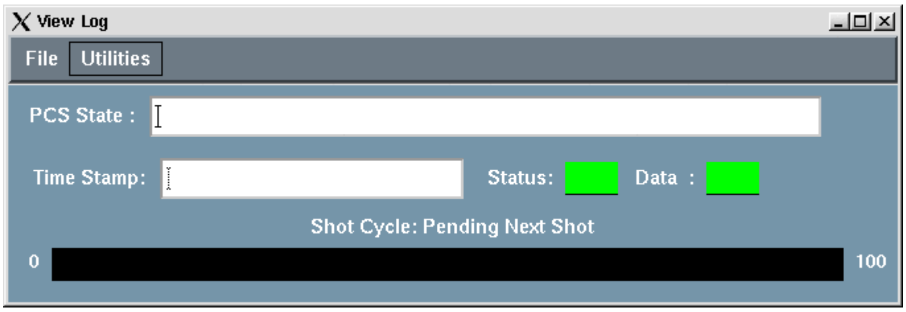

Image size is controlled by specifying the width relative to the page width in percent.

Links are always relative to the file location!

13.3.5.6 Links

Link to document on the Web:

```
For the full DocBook tagset, see
<ulink url="http://www.docbook.org/tdg/en/html/docbook.html">
DocBook: The Definitive Guide</ulink>.
```

For the full DocBook tagset, see DocBook: The Definitive Guide [1165].

Link to an email address:

```
Author:
<ulink url="mailto:john.storrs@ukaea.org.uk">John Storrs</ulink>.
```

Author: john.storrs@ukaea.org.uk.

Link to another document on the local server:

```
Here is the <ulink url="../imports/style.css">style sheet</ulink> for this document.
```

Here is the style sheet [1166] for this document.

Links are always relative to the file location!

[1165] http://www.docbook.org/tdg/en/html/docbook.html
[1166] https://www.efda-itm.eu/ITM/imports/itm/public/style.css

13.3.5.6.1 Links within the ITM website

The automatic html/pdf generator engine allows for a sophisticated system of links within the ITM website.

Targets for links within the ITM website may be any <**section**> , <**para**> , or <**anchor**> tags which have an **"id" attribute** .

Examples:

```
<section id="target1">
<para id="target2">
<anchor id="target3"/>
```

The <anchor> tag is a "silent" target which has no content of its own and only serves as a target for links.

Some special rules apply:
Every standalone xml document must start with a <**section class="topic" id="..."**> or a <**section class="import" id="..."**> tag. These tags have to have the **"id" attribute** . The **"class" attribute** must come first. Only double quotes are allowed.

Do NOT put <section>, <para>, or <anchor> on the same line.

A link is then created by using the <**link**> tag with the **"linkend" attribute** to specify the target (see example below).

```
This links to the <link linkend="sectionId">Sections</link> section above.
```

This links to the Sections (13.3.5.1) section above. The id attributes must be unique in a document.

The Perl/Python engine will generate the appropriate links in the html and pdf versions of the website. If a link target lies outside a pdf document (for instance because only a part of the website was converted into pdf), the engine automatically creates an external link to the correct web address on the ITM server. By this, even for the pdf of a part of the website all links are fully functional.
The web addresses of external links appear in full as footnotes in the pdf.

13.3.5.7 Verbatim

```
<screen>
This is verbatim layout
   It is typeset in a fixed-width font.
      Spacing is preserved.
</screen>
```

results in

```
This is verbatim layout
   It is typeset in a fixed-width font.
      Spacing is preserved.
```

If the verbatim content includes the special xml characters '<' or '>' (eg xml text or program code), they must be replaced by '<' and '>'. Please be careful when using the verbatim environment inside other environments, i.e. elements. Do not use <screen> elements inside <box> elements!

13.3.5.8 Text Formatting

The text formatting elements typewriter text and emphasis are included in DocBook.

```
<mono>This is typewriter text.</mono>
```

results in

`This is typewriter text.`

```
<emphasis>This is emphasized text.</emphasis>
```

results in

This is emphasized text.

13.3.6 DocBook Extensions

DocBook extensions provided in Practical XML include:

13.3.6.1 File Inclusion

Simple xml file inclusion is achieved like this:

```
<include file="introduction.xml"/>
<include file="developmenttools.xml"/>
<include file="hardware.xml"/>
<include file="firmware.xml"/>
<include file="software.xml"/>
<include file="hardwaretesting.xml"/>
<include file="softwareupdates.xml"/>
```

The included xml file must have a <section> element with a **class attribute** as its root element. There are two special **classes** of the <section> element.

1. **class="topic"** : This section class defines a new html page. It also creates a section in the pdf version. Therefore, please complete it with a <title> element.
2. **class="import"** : This section class defines a mere import of the enclosed xml without the creation of a new html page. This is especially useful when the XML material shall be used in various locations of the website. No explicit section is created in the pdf version. A title element is therefore not required.

Important:
Do NOT create circular inclusions!

13.3.6.2 Maths

Latex maths can be embedded in DocBook documents in a math element. Here are some examples:

```
<math>\[ 2\sum_{i=1}^n a_i \int^b_a f_i(x)g_i(x)\,\mathrm{d}x \]</math>
```

produces this:

$$2\sum_{i=1}^n a_i \int^b_a f_i(x)g_i(x)\,\mathrm{d}x$$

and this:

```
<math>$$ 2\sum_{i=1}^n a_i \int^b_a f_i(x)g_i(x)\,\mathrm{d}x $$</math>
```

produces this:

$$2\sum_{i=1}^n a_i \int_a^b f_i(x)g_i(x)\,\mathrm{d}x$$

To get a better alignment for inline maths, use the <inmath> element.

```
<inmath>\[ 2\sum_{i=1}^n a_i \int^b_a f_i(x)g_i(x)\,\mathrm{d}x \]</inmath>
```

produces this:

$$2\sum_{i=1}^n a_i \int_a^b f_i(x)g_i(x)\,\mathrm{d}x$$

Here are some more inline maths: x^{2n-1} and $\sqrt[3]{8}$.

13.3.6.3 Text Formatting

The standard set of text formatting elements, like bold face, italic, and underline have been added to the DocBook scope.

```
<bold>This is bold face.</bold>
```

results in

This is bold face.

```
<italic>This is italic.</italic>
```

results in

This is italic.

```
<underline>This is underlined text.</underline>
```

results in

This is underlined text.

13.3.6.4 Text Colors

A total of 10 text colors have been added to the DocBook definitions. The <color> tag carries the attribute `name` which allows specification of the text color by name (see table below).

Table 4793: Text Colors

source	result
<color name="black">text color is black</color>	text color is black
<color name="red">text color is red</color>	text color is red
<color name="gray">text color is gray</color>	text color is gray
<color name="blue">text color is blue</color>	text color is blue
<color name="pink">text color is pink</color>	text color is pink
<color name="cyan">text color is cyan</color>	text color is cyan

Table 4793: Text Colors

source	result
<color name="green">text color is green</color>	text color is green
<color name="gold">text color is gold</color>	text color is gold
<color name="sienna">text color is sienna</color>	text color is sienna
<color name="orange">text color is orange</color>	text color is orange
<color name="goldenrod">text color is goldenrod </color>	text color is goldenrod
<color name="lightgreen">text color is lightgreen </color>	text color is lightgreen
<color name="purple">text color is purple </color>	text color is purple

13.3.6.5 Boxes

```
<box>
This environment frames the included text with a box. It is a mandatory
alternative to <screen> if a <math> element is included.
</box>
```

This environment frames the included text with a box. It is a mandatory alternative to <screen> if a <math> element is included. Do not use a <screen> element inside a box environment! Rather stack <box> elements.

13.3.6.6 Lines

```
<hrule/>
```

produces a horizontal line

13.3.6.7 Special Characters

Special characters like **diacritics** have been added to the DocBook scope. If you like to use diacritics in xml, please use the html entities, i.e. é for é.
For a complete list of diacritics please see HTML:Special Characters [1167]. Only the diacritics have been included so far.

13.3.6.8 Blanks

Neither XML nor HTML maintain blanks inside a document but rather condense all whitespaces into single blanks. If you like to deliberately add blanks to your document (html and pdf), you will have to use either the <screen> environment or the <**spaces number="..."/**> tag. Its **"numer" attribute** specifies the number of blanks you would like to insert.

Example:

```
no spaces<newline/>
<spaces/>1 space<newline/>
<spaces number="1"/>1 space<newline/>
<spaces number="2"/>2 spaces<newline/>
<spaces number="3"/>3 spaces<newline/>
<spaces number="4"/>4 spaces<newline/>
<spaces number="5"/>5 spaces<newline/>
<spaces number="10"/>10 spaces<newline/>
```

[1167] http://www.utexas.edu/learn/html/spchar.html produces the following:

no spaces
 1 space
 1 space
  2 spaces
   3 spaces
    4 spaces
     5 spaces
          10 spaces

---

last update: 2013-03-04 by dpc

13.4 How to categorize imported documents.

Documents which are placed in the `imports/` directories and added via a <ulink> element can be categorized using a variety of attributes for the <ulink> tag.
Categorized documents will appear ordered by category in the ITM Document Catalog (26) and are therefore much easier to identify and to find than uncategorized documents. The categorization has to be done by hand but is worth the extra bit of effort.

Attributes for the categorization:
Besides the standard attribute `$url` , there are 10 optional attributes for the <ulink> tag which are described in the following. All 10 attributes have to present for the corresponding document to be categorized. Documents which have been categorized at one location in the XML tree of the ITM website do not need to be categorized again when linked to the website at a different location.

- *title* - The actual title of the document. May be different from the working title inside the <ulink> tag.
- *type* - The classification type of the document. Current classification types are:
  - administrative
  - documentation
  - movie
  - poster
  - presentation
  - report
  - technical
  - tutorial

  Missing classification types may be added with the consent of the publication team.
- *project* - This is the ITM project's name under which the document was **created** . This attribute is intended to show which project is responsible for a potential maintenance of the document. Allowed values are:
  - edrg
  - amns
  - isip
  - imp12
  - imp3
  - imp4
  - imp5
  - ism
  - tfl
- *author* - The last name(s) of the main author.
- *year* - The year when the document was last modified in the format YYYY.

- *month* - The month when the document was last modified in the format MM.
- *topic* - The general physics/numerics/math topic under which the document might be placed. Currently, the following topics are available:
  - control
  - ecrh
  - equilibrium
  - fast particles
  - general
  - grid
  - heating
  - icrh
  - infrastructure
  - legal
  - machine descriptions
  - mhd
  - monitoring
  - nbi
  - numerics
  - transport
  - turbulence
  - workflows

  Since this list is not exhaustive, you are welcome to add new topics as you wish. However, please keep in mind that a too granular categorization is of little use.
- *complexity* - Please carefully assess the complexity of the document for categorization. The complexity levels are:
  - introductory
  - standard
  - expert
- *addressee* - Whom is the document mainly targeted at? Addressees are:
  - user
  - developer
  - public
- *size* - Number of pages of the document if applicable (else 0).

The order of the attributes is free. All values have to be enclosed in double quotes ("). Avoid leading or trailing spaces.

An example for a categorized import (here edrg) is shown below:

```
<ulink url="../imports/meetings/2009/EDRG_kickoff/edrg_kick-off.ppt"
title="Experimentalists and Diagnosticians Resource Group (EDRG) - Kick-off Meeting"
type="presentation" project="edrg" author="Coelho" year="2009" month="01"
topic="control" complexity="standard" addressee="public" size="15">
Overview of EDRG for 2009 (R.Coelho)</ulink>
```

13.5 How to work with Subversion under Gforge

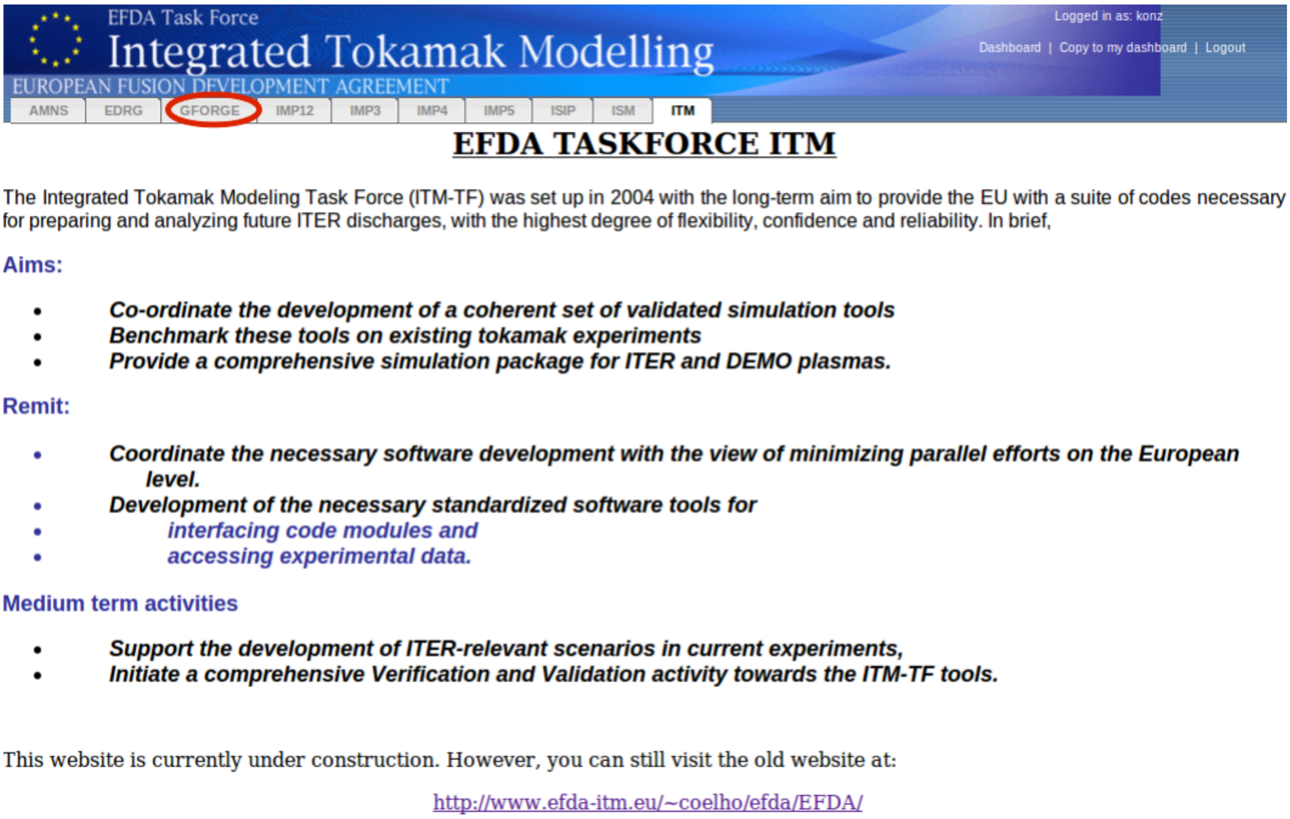
13.5.1 Introduction

The ITM-TF uses the Gforge system (29) as its Collaborative Development Environment (CDE) (29) .
The system features a variety of tools like trackers, bug reports, newsfeeds, a content management system (CMS) (29) , Wikis, Forums, and documentation systems to facilitate the development of projects. Above all it hosts the repositories of the projects under development and features various version control systems.
The ITM-TF has opted for Subversion as its tool for version control. The following material is supposed to serve as an introduction to the use of subversion under Gforge.

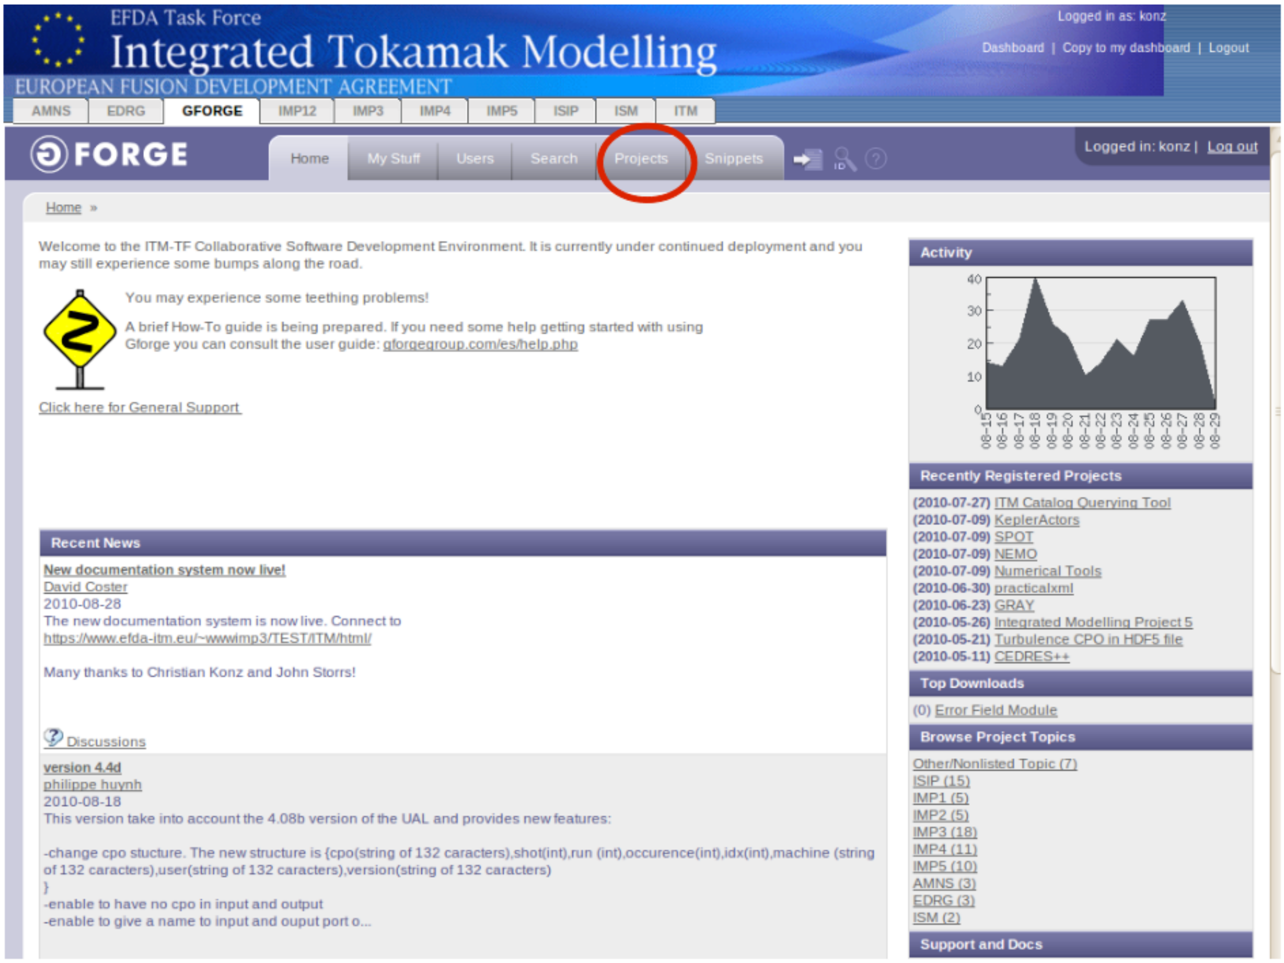
13.5.2 Projects in Gforge

Subversion repositories are projects in Gforge.

After logging in to the ITM Portal (29) you should be seeing the ITM-TF front page.



Click on the register called *Gforge* on the top of the page (marked by a red circle) to access Gforge.



You are then taken to the front page of Gforge which shows recent news, a list of recently registered projects, and a diagram of the recent commit activity of all ITM projects under Gforge.

Click on the register labelled *Projects* to access the list of projects.

Full name	Account name (lowercase)	Description
XMLLIB	xmllib	An F95 library for parsing XML coded code parameters.
WS2K	ws2k	Graphical tool for automatic generation of Web Services
VisIt Visualization	visit_visu	Visualization of CPO fields through a VisIt plug-in
UAL	ual	ITM UAL
Turbulence CPO in HDF5 file	trurbulence_cpo	Routines which store the content of the turbulence CPO into a HDF5 file.
TRAVIS	travis	ECRH/ECCD
Testing GForge	test2009	Project to test the GForge features
SVNSYNC_TEST	svnsync_test	Test project for synchronizing with external SVN repositories, as proposed by David Coster. The testing will be done by Vasile Pais, Trach-Minh Tran and Olivier Sauter.
SPOT	spot	Simulation of fast ion propagation using an orbit following Monte Carlo method via the guiding centre technique
skel	skel	A skeleton for developing Fortran MPI and non-MPI (serial) time dependent program.
scripts (ISIP, platform management)	scripts	Scripts of general use, provided by ISIP for the management of platform-related environment variables, Kepler actors, ...
ScicosLab43	scicoslab43	Custom version of ScicosLab GTK 4.3 with build in Code Generator for Kepler
SAWTEETH model	sawteeth	Sets of routines to describe a sawteeth model, calculating the trigger criteria and if a crash should be performed, the post-crash profiles
QWA-2	qwa2alphanum	Test of Version Control
Python Visualization	python_visu	Visualization of data coming from the UAL with Python tools (UAL interface, numpy/matplotlib, Kepler actor)
practicalxml	practicalxml	web publishing tool
Orbit-following Monte Carlo code ASCOT	ascot	ASCOT (Accelerated Simulation of Charged-particle Orbits in Tokamaks) orbit-following Monte Carlo code
Numerical Tools	numerical_tools	This project hosts all ITM-TF related numerical tools like fitting and interpolation routines, grid generation, AMR routines, etc.
NTM module	ntmmodule	Provide NTM module within IMP2 to provide time evolution of the island width and frequency using modified Rutherford equation
ntm_Deff	ntm_deff	Determine new Diffusion coefficients due to presence of NTM mode
NEOWES	neowes	Neoclassical transport module using formulae from Tokamaks, by J Wesson
NEMORB	nemorb	The global electromagnetic gyrokinetic code ORB5.
NEMO	nemo	Simulation of neutral beam injection, deposition and attenuation.

AMNS | EDRG | GFORGE | IMP12 | IMP3 | IMP4 | IMP5 | ISIP | ISM | ITM

Kepler	kepler	Updated version of the code platform, implementation of debugging facilities
ITM_SHARED	itmshared	To capture in one place shared tools, definitions, etc. Initially, the proposed itm_types and itm_constants.
ITMPortal	itmportal	ITM Portal
itm_documentation	doc_test	This project hosts the web pages for the installation of an svn based documentation system.
ITM Catalog Querying Tool	catalog_qt	Web interface for querying the ITM simulation catalogue
ITM Catalog	itmcatalog	ITM Catalog support
ITM-10-IMP3-T4	itm10imp3t4	Verification and validation of edge codes
ITM-10-IMP3-T3	itm10imp3t3	Implementation and integration of edge codes
ITM-10-IMP3-T2	itm10imp3t2	ITER Scenario Modelling (ISM)
ITM-10-IMP3-T1	itm10imp3t1	Maintenance, continuing development, verification and validation of the ETS
ITM-09-IMP3-T7	itm-09-imp3-t7	Implementation of kinetic edge codes on the Gateway machine
ITM-09-IMP3-T6	itm-09-imp3-t6	Implementation of 3d edge code(s) on the Gateway Machine
ITM-09-IMP3-T5	itm-09-imp3-t5	Extension of edge code simulations to the (real) wall
ITM-09-IMP3-T4	itm-09-imp3-t4	Continuation of the development and implementation of edge CPOs (including core-edge coupling)
ITM-09-IMP3-T3	itm-09-imp3-t3	Continuation of edge code validation
ITM-09-IMP3-T2	itm-09-imp3-t2	Use of the modules and interfaces, comparison with existing 1D codes and experiment (validation and verification)
ITM-09-IMP3-T1	itm-09-imp3-t1	Maintenance and continuing development of the ETS
ISE	ise	Integrated Simulation Editor
Interpolation and extrapolation routine	interpos	Provide an easy, flexible and precise routine for interpolation and calculation of derivatives and integrals on a new mesh. Allows for extrapolation as well. Includes smoothing based on cubic spline with tension, minimizing second derivatives.
Integrated Modelling Project 5	imp5	The aim of the Integrated Modelling Project #5 on "Heating, Current Drive and Fast Particles" is to develop a package of codes for prediction and interpretation of heating, current drive and fast particle effects. The areas to be covered include ECRH, ICRH, NBI, LH, alpha particles and fast particle interaction with instabilities. The ultimate goal is to enable self-consistent simulation of heating and current drive in the presence of fast particle instabilities, especially for ITER.
Integrated Modelling Project 3	imp3	Parent project for IMP3.

Add new Project | Filter by category

1 2 Next >

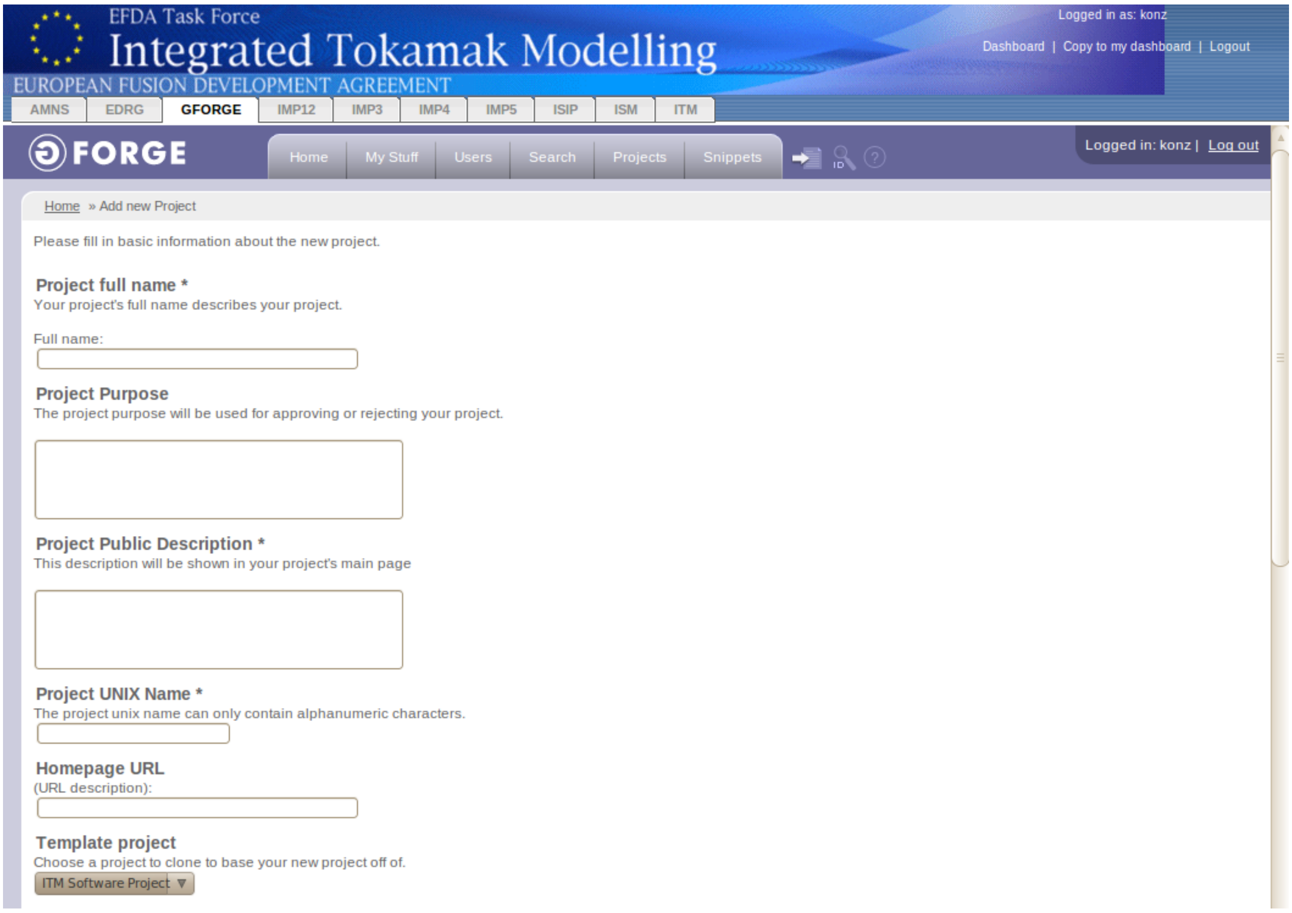
Search for projects in all categories

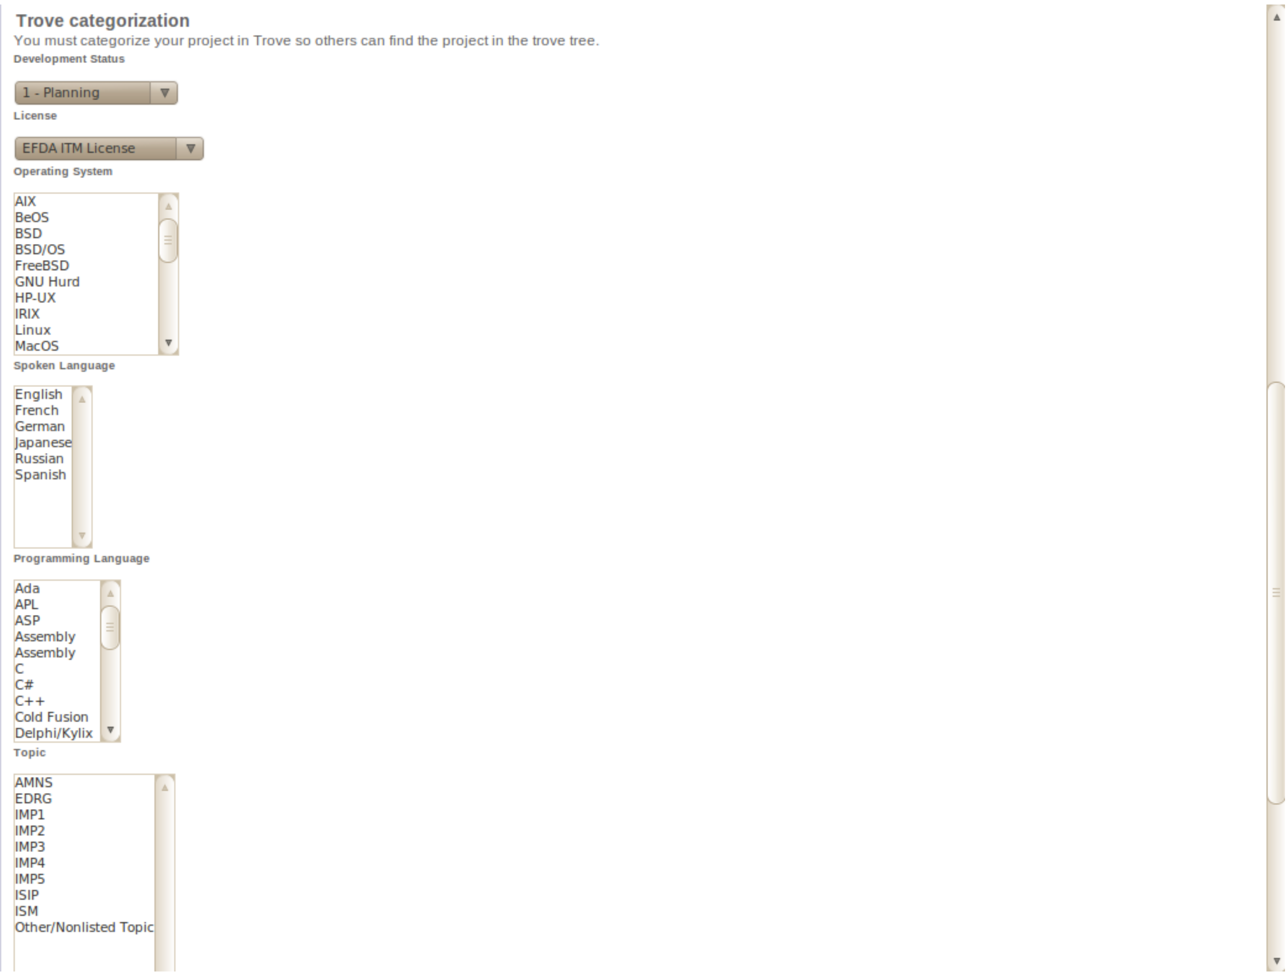
Search

Enter * to return all

To search for projects, please enter the criteria in the text box and press "Search" to get the results

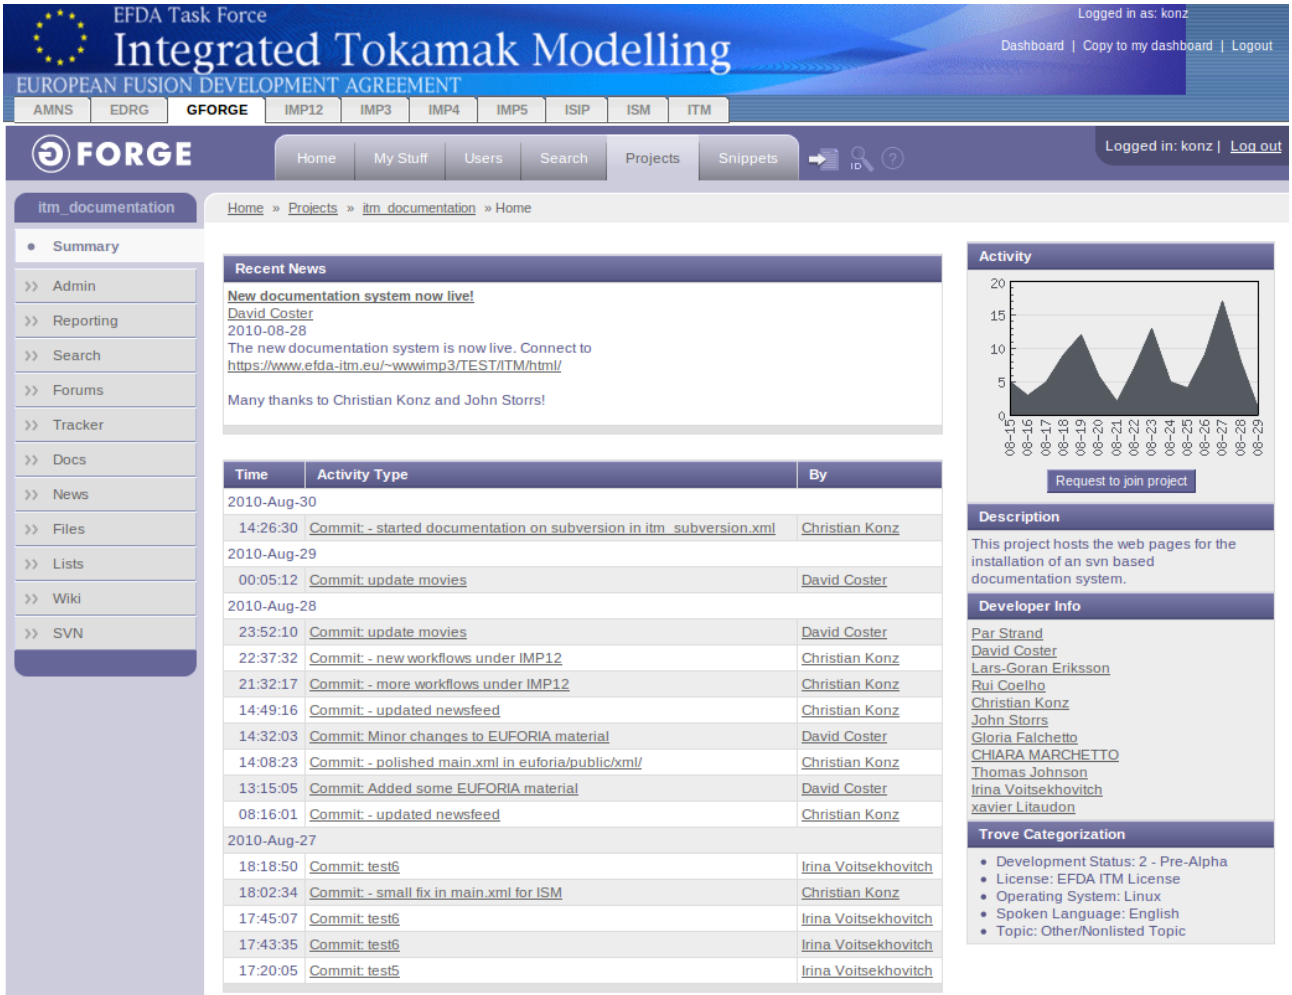
The list shows you full names, the account names, and short descriptions of all the ITM projects under Gforge. The **account names** are simultaneously the names of the corresponding repositories under subversion.
At the bottom of the page, you will find a button labelled *Add new Project* (marked by a red circle). By clicking this button you will be taken to the registration page for new projects under Gforge. If you like to start a new project by creating a fresh repository, this is what you have to do.



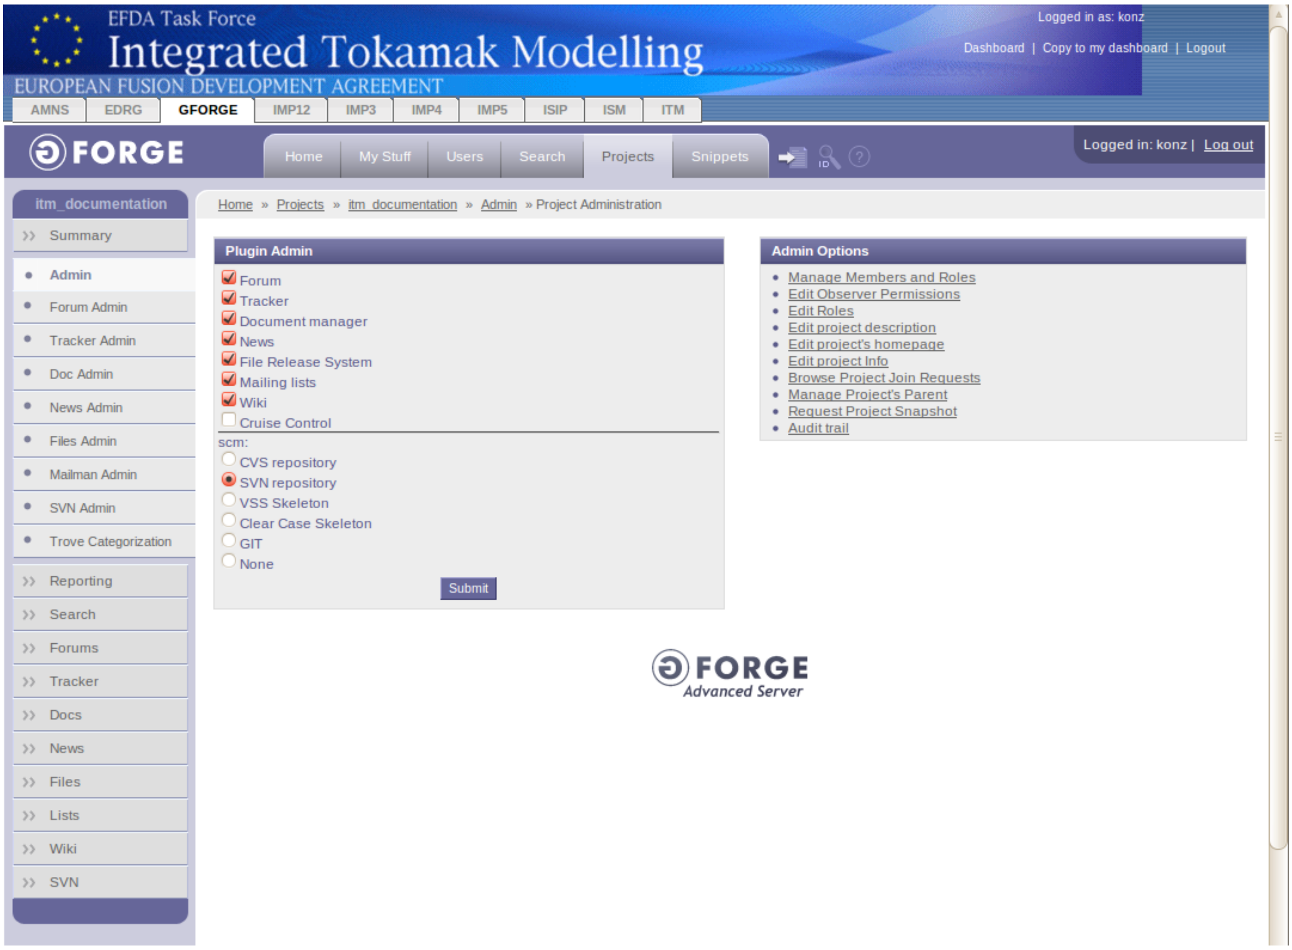


On the registration page, you are asked to specify a variety of details about the project including a short description of the project and the trove categorization. The critical field is the one labelled *Project UNIX Name* which determines the name of the subversion repository.
Once you filled all the fields and selected an appropriate categorization, you should hit the *submit* button to create your project. Please ensure that you do not duplicate already existing projects.

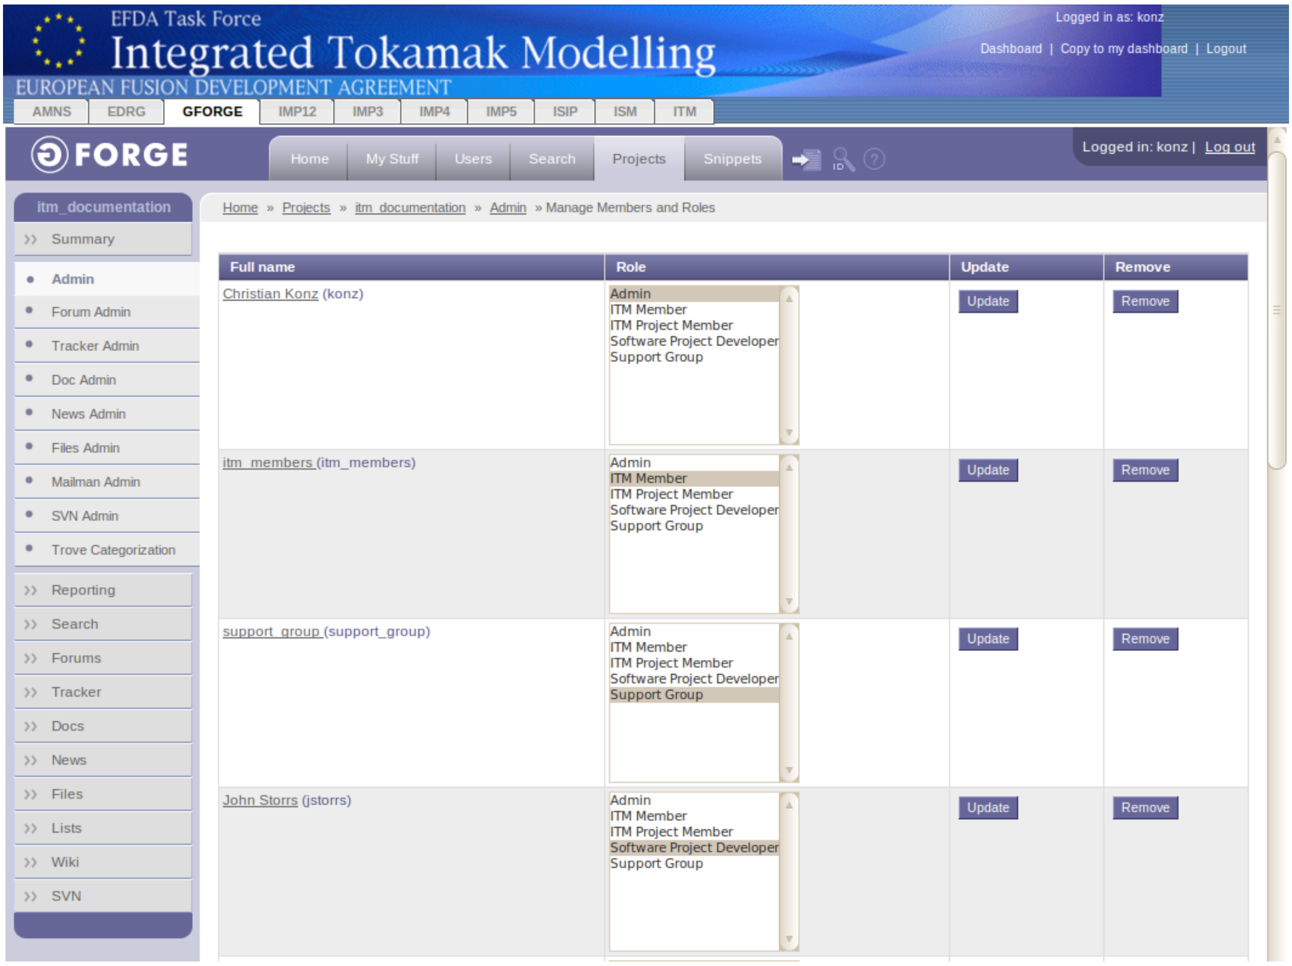
By clicking on any of the projects in the project list you are taken to the project page. Below you see the example of the *doc_test* project page.



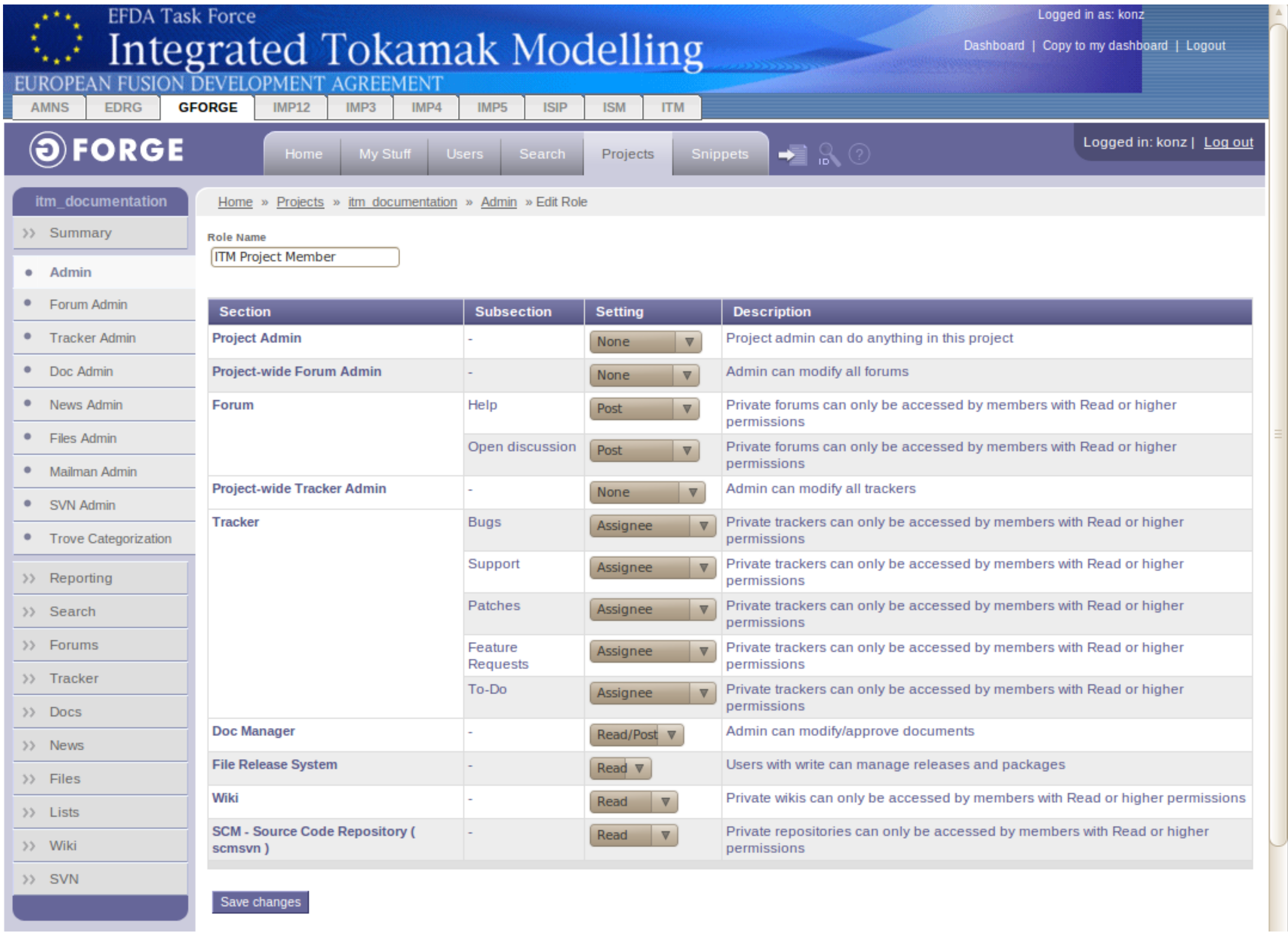
On the project page, you see a diagram showing the project's activity and a list of the recent commit messages. You'll also find a button *Request to joing project* which you might use to join a project (see How to become a member of a Gforge project (13.8)).
Furthermore, you'll find a list of all developers for this project and a short description of the project together with the trove categorization.
If you have administrator rights for a project, you might click on the *Admin* register on the left-hand side.



In the *Admin* section, you may manage members of the project and their roles, define and modify roles, honor 'requests to join' and much more. The key item here is *Manage Members and Roles* .



In this section, you can manage each member's access permissions to the subversion repository. This can be done for a single user or for an entire group. A predefined group for instance, which has read access to the repository, is *ITM Members* . Every ITM member is automatically granted read access to your repository. If you like to change this, you need to got to the *Edit Roles* section.



Here you can set access permissions in a granular way. If you like to change the access permission to the subversion repository, have a look at the SCM settings.

last update: 2012-07-18 by coster

13.6 How to handle code specific parameters

This section explains how to treat code specific parameters in the framework of the ITM-TF.

Code specific parameters are all parameters which are specific to the code (like switches, scaling parameters, and parameters for built-in analytical models) as well as parameters to explicitly overrule fields in the ITM data structures.
Generally no data (should go into CPOs (29)).

ITM Convention:
As the rest of the data structures, all code specific parameters should be given in XML format, i.e., in form of an XML string.

Each CPO features a structure called `codeparam` which, among other information like code name and version, contains the string or string array `parameters` to receive the XML string.

For `Fortran90` the data type definitions are shown below:

```
type type_codeparam  !
  character(len=132), dimension(:), pointer ::codename => null()       ! /codeparam/codename - Name of the code
  character(len=132), dimension(:), pointer ::codeversion => null()       ! /codeparam/codeversion - Version of the code (as in the ITM repository)
  character(len=132), dimension(:), pointer ::parameters => null()       ! /codeparam/parameters - List of the code specific parameters, string expected to be in XML format.
  character(len=132), dimension(:), pointer ::output_diag => null()       ! /codeparam/output_diag - List of the code specific diagnostic/output, string expected to be in XML format.
  integer  :: output_flag=-999999999       ! /codeparam/output_flag - Output flag : 0 means the run is successful, other values meaning some difficulty has been encountered, the exact meaning is then
endtype

type type_param  !
  character(len=132), dimension(:), pointer ::parameters => null()       ! /param/parameters - Actual value of the code parameters (instance of coparam/parameters in XML format).
  character(len=132), dimension(:), pointer ::default_param => null()       ! /param/default_param - Default value of the code parameters (instance of coparam/parameters in XML format).
  character(len=132), dimension(:), pointer ::schema => null()       ! /param/schema - Code parameters schema.
endtype
```

In addition to the data structure type `type_codeparam` which contains the above mentioned XML string, a data structure type `type_param` has been defined. This structure is used by the automatic actor (29) generator tool FC2K (29) . It contains three fields, all of which are string arrays. The first field `parameters` is to hold the actual code specific parameters, whereas the second field `default_param` allows for the defintion of a complete set of default values for the code specific parameters. The third field `schema` finally shall hold the W3C XML schema which describes the code specific structure of the XML string in `parameters` .

For `C/C++` the structure `codeparam` is defined as a struct (see below).

```
struct codeparam {
std::string codename;
std::string codeversion;
std::string parameters;
std::string output_diag;
int output_flag;
} codeparam;
```

The XML string to hold the code specific parameters is stored in the string `parameters` .

13.6.1 Why XML?

- extremely versatile markup language ('generalisation' of HTML)
- self-describing data through use of DTDs (document type definitions) or W3C schemas
- simple to edit: plain ASCII, similar to HTML
- can handle all levels of complexity
- large and fast growing user community
- large infrastructure of tools for XML creation, manipulation, and usage: XPath, XPointer, XSLT, XSL-FO, CSS, parsers, editors, browsers, etc.
- already in use for CPO definitions
- allows separation of generic tools and code specific parameters

A real world example for code specific parameters in the form of an XML string is shown in the figure below.

```xml
<?xml version="1.0"?>

<?xml-stylesheet type="text/xsl" href="./input_helena.xsl"
charset="ISO-8859-1"?>

<parameters>

<!-- profile parameters -->

 <profile_parameters>
   <hbt> .false. </hbt>
   <input_type> p' and FF' </input_type>
   <radial_coordinate> psi </radial_coordinate>
 </profile_parameters>

<!-- shape parameters -->

 <shape_parameters>
   <isol> 0 </isol>
   <ias> 1 </ias>
   <imesh> 2 </imesh>
   <n_acc_points> 2 </n_acc_points>
   <s_acc> 0.7 1.0 </s_acc>
   <sig> 2.5 0.1 </sig>
   <weights> 0.1 1.0 </weights>
   <equidistant> 0. </equidistant>
 </shape_parameters>

<!-- ... and so on ... -->

<!-- diagnostics parameters -->

 <diagnostics_parameters>
   <verbosity> 4 </verbosity>
   <output> full </output>
   <diagnostics_on> .true. </diagnostics_on>
   <standard_output> .true. </standard_output>
 </diagnostics_parameters>

</parameters>
```

The example shows a reduced set of code parameters for the fixed boundary equilibrium module `HELENA` . It demonstrates in a nice way the use of XML for code parameters. Every tag, i.e. the elements enclosed in the brackets '<' and '>' must be closed which is done by the closing tag which is enclosed by '</' and '>'.
The first two elements are standard for any XML document. The first defines the version of XML being used while the second defined a style sheet for visualizing the XML string in a browser. The second element is optional and only becomes operational when you provide a style sheet - marked by the suffix `.xsl` .
The root tag, which is the outermost container of all other elements, should be the `parameters` element.
Comments of arbitrary length may be added using the `'<!--'` and `'-->'` delimiters.
The XML document can have an arbitrary structure and depth. The actual values of the code parameters are entered between the enclosing tags as simple ASCII. All types, e.g. strings, integers, floats, booleans are possible as well as arrays of them. Elements in arrays shall be separated by spaces only (no commas) and appear as simple lists. No quotes are used for strings. The values for boolean elements depend on which programming language will process them. E.g. Fortran90 allows for `.true.` and `.false.` as valid values.
The order of elements can be arbitrarily chosen. Only the structure, i.e. enclosing container tags, matters.

13.6.2 W3C XML Schemas

Among the many possibilities the ITM-TF has opted for the use of W3C XML schemas to describe which elements are allowed in the XML code parameter string for an ITM-TF module. The definition of a schema allows for the design of generic tools through the seperation of the specific structure of the code parameters of a specific module from the development of those tools. By defining a W3C XML schema, all code specific information is cast into a single file which is itself an XML string. Therefore, the same tools, e.g. XML parsers, can be used for both the code parameters as well as the XML schema.
For more details please refer to the Tutorial on W3C XML Schemas (13.6.11).

13.6.3 How to convert Code Parameters into XML

To convert the code parameters of an existing physics code into XML, you will have to carry out 3 major steps. A variety of tools have been developed by the ITM-TF to assist you in this process.

13.6.3.1 Step 1: Extraction - XML Schema

In a first step, you should extract the structure of the code specific parameters (i.e. names, types, structures, dimensions, allowed choices and ranges, etc.) into a separate file, the so-called **W3C XML Schema** .
The tool **CREATE_SCHEMA** (13.6.5)in the project `xmllib` may help you to automatically generate a skeleton XML schema from a simple ASCII list of your code parameters.

Advantages:

- no format specific read subroutines needed anymore
- all tools can be made generic
- all code specific information stored in one single external file or XML string
- creation of the schema is a 'once-in-a-code's-lifetime' event
- later changes very simple through changing the schema
- enables *input checking* before running the code
- schema serves as *minimum documentation* for input

13.6.3.2 Step 2: Conversion - XML File

In a second step, you should convert your former input files containing the code parameters into XML input files like the one shown in the section Why XML? (13.6.1). These XML input files are *instances* of the XML schema of the code.
No tools to assist you with this conversion yet exist but tools to generate empty XML input files as well as to convert Fortran namelist files into XML input files are currently under development.

Advantages:

- text input files easier to understand by user
- same advantage as namelist: input does not have to be complete
- free order of input parameters as long as structure is not changed
- possibility to define beginner's and expert's settings
- input checks possible
- XML can be used for namelist input as well as any other format

13.6.3.3 Step 3: Assignment Function

In the third step, you need to create the so called assignment function. This function assigns the values from your XML input file to the corresponding variables in your code. Since compiler languages like Fortran or C/C++ do not know *introspection* , this function cannot be created in a generic way. It's specific shape depends on the structure of the specific code.
It can however be automatically generated for simple W3C XML schemas using the **CREATE_ASSIGN** (13.6.6)tool (so far only for Fortran90 modules) of the project `xmllib` .

Advantages:

- generic tools have to be developed only once and can be used for any code
- generic tools as separate library - easier to maintain
- GUI development or use of existing GUIs become possible (e.g. xforms in a browser)
- users do not need to know about XML at all
- developers need to know only very little about XML

13.6.4 ITM XML Parser

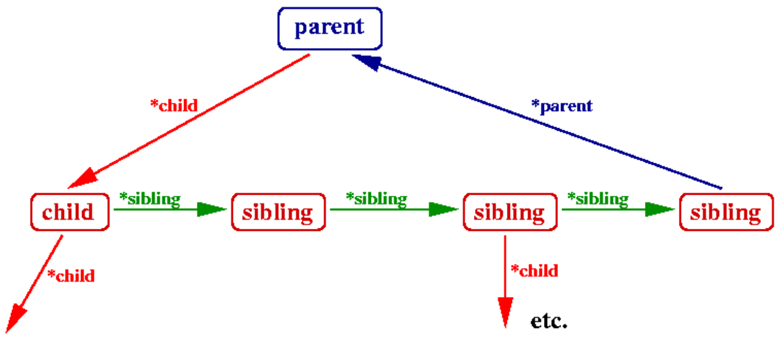
A large variety of parsers for XML are available in the XML community. However, to be able to quickly adapt the parsers, the ITM-TF has developed its own simple XML parsers in Fortran90 and C/C++. These parsers were specifically designed to fulfill the needs of the ITM-TF and to work smoothly with its infrastructure.

13.6.4.1 Fortran90

Lightweight Fortran90 parser for XML documents:

- compact (~500 lines Fortran90), efficient, fast parser
- parses XML documents with arbitrary depth and complexity (except for attributes)
- based on W3C XML Schemas (can be used to validate XML documents)
- uses tree-like lists with parent, child, and sibling pointers
- tag names and value lists of arbitrary length (dynamical memory allocation)
- available as module `euitm_xml_parser`
- first parses the code specific W3C schema, then parses the entire XML document sequentially like SAX
- comes with useful subroutines in `xml_tools.f90` and `string_manipulation_tools.f90`

Tree Structure



euitm_xml_parse:

- input parameter of type `type_param` contains the XML schema in string array `schema` and the XML string for the code parameters in string array `parameters`
- parses the schema and builds an empty tree with the structure described by the schema: associates the corresponding pointers, allocates the tag names `cname` and fills in the tag names
- parses the actual XML document and fills the parsed values `cvalue` into the tree
- returns the complete tree in `parameter_list` and the number of successfully parsed parameters `nparm`

For information on how to call the Fortran90 XML parser please refer to the section on CREATE_ASSIGN (13.6.6).

check out project `xmllib`

```
svn co https://gforge6.eufus.eu/svn/xmllib target_dir
```

The Fortran90 XML Parser can be found in `trunk/src/` .

13.6.4.2 C/C++

under construction

13.6.5 Creating XML schemas with CREATE_SCHEMA

```
-+shot                                ! shot related parameters
  source        string*15             ! source specifier
  nshot         integer
  tshot         float                 ! time slice
-+options                             ! option parameters
  udsym         boolean               ! up-down symmetric
  psibnd        float
  mfm           integer
```

Create a parameter list in `parameter_list.txt` like the one in the example above:

- precede namelist or block names with '-+' level identifiers
- list name, type, and dimension for each parameter in namelist
- specify length of strings with '*' right after 'string' type
- add comments following '! '
- names must be alphanumeric, no special characters, no spaces, underscores allowed

check out project `xmllib`

```
svn co https://gforge6.eufus.eu/svn/xmllib target_dir
```

The tool `CREATE_SCHEMA` can be found in `branches/toolbox/schema_generator/` .

Run CREATE_SCHEMA

- move `parameter_list.txt` into `input/`
- `gmake -f makefile_pgi` in `obj/`
- `./create_schema.e` in `run/`
- generates `w3c_schema.xsd` in `output/`

```
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema">

  <!-- document element -->
  <xs:element name="parameters">
    <xs:complexType>
      <xs:all>
        <xs:element ref="shot"/>
        <xs:element ref="options"/>
      </xs:all>
    </xs:complexType>
  </xs:element>

  <!-- shot related parameters -->
  <xs:element name="shot">
    <xs:complexType>
      <xs:all>
        <xs:element ref="source"/>
        <xs:element ref="nshot"/>
        <xs:element ref="tshot"/>
      </xs:all>
    </xs:complexType>
  </xs:element>

  <!-- option parameters -->
  <xs:element name="options">
    <xs:complexType>
      <xs:all>
        <xs:element ref="udsym"/>
        <xs:element ref="psibnd"/>
        <xs:element ref="mfm"/>
      </xs:all>
    </xs:complexType>
  </xs:element>

  <!-- source specifier -->
  <xs:element name="source">
    <xs:simpleType>
      <xs:restriction base="xs:string">
        <xs:maxLength value="15"/>
      </xs:restriction>
    </xs:simpleType>
  </xs:element>
```

Polish and improve your schema (optional):

- add `minOccurs="0"` if parameter is optional
- add range restrictions for integers and floats by defining new `simpleTypes` using restriction with `minInclusive` and `maxInclusive` or `minExclusive` and `maxExclusive`
- define allowed options for strings or integers using `pattern`
- limit length of arrays by using `maxLength`
- etc., etc.

13.6.6 Creating assignment functions with CREATE_ASSIGN

The automatic creation of the assignment functions is currently only available for Fortran90. An equivalent tool for C/C++ is yet to be created.

13.6.6.1 Fortran90

The tool `CREATE_SCHEMA` uses the previously defined list `parameter_list.txt` and the generated schema `w3c_schema.xsd` to automatically generate a Fortran90 subroutine `assign_code_parameters.f90` which can be used to assign the code parameters read from the XML string to the internal variables of your module.
To generate the assignment subroutine first check out project `xmllib`

```
svn co https://gforge6.eufus.eu/svn/xmllib target_dir
```

The tool `CREATE_ASSIGN` can be found in `branches/toolbox/assignment_generator/` .

Run CREATE_ASSIGN

- move parameter_list.txt into input/
- move w3c_schema.xsd into input/
- gmake -f makefile_pgi in obj/
- ./create_assign.e in run/
- generates assign_code_parameters.f90 in output/

```
subroutine assign_code_parameters(code_parameters, return_status)

!-----------------------------------------------------------------------
! calls the XML parser for the code parameters and assign the
! resulting values to the corresponding variables
!-----------------------------------------------------------------------

  use itm_types

!Add the modules hosting the relevant variables here!

  use euitm_schemas
  use euitm_xml_parser

  implicit none

  integer(itm_i4), parameter :: iu6 = 6

  type (type_param) :: code_parameters
  integer(itm_i4), intent(out) :: return_status

  type(tree) :: parameter_list
  type(element), pointer :: temp_pointer
  integer(itm_i4) :: nparm, n_values
  character(len = 132) :: cname

  nparm = 0
  n_values = 0
  return_status = 0      ! no error

!-- parse xml-string code_parameters%parameters using W3C XML schema in
!   code_parameters%schema
  call euitm_xml_parse(code_parameters, nparm, parameter_list)

!-- assign variables

  temp_pointer => parameter_list%first

  outer: do
    cname = char2str(temp_pointer%cname)   ! necessary for AIX
    select case (cname)
      case ("parameters")
        temp_pointer => temp_pointer%child
        cycle
      case ("shot")
        temp_pointer => temp_pointer%child
        cycle
```

CREATE_ASSIGN generates the Fortran90 subroutine assign_code_parameters.f90 which if called will do everything which is needed to read the XML schema, parse the XML string, and assign the values found in the XML string to the corresponding variables in the code. In most cases, no or very little manipulation of this subroutine is needed, for instance in the case of deep structures (more than 2 levels) and arrays. Please refer to existing schemas and assignment routines, like those for the **HELENA** module, for guidance.

The tool CREATE_ASSIGN assumes that the variable names in your code agree with the names which you have chosen for the code parameters.

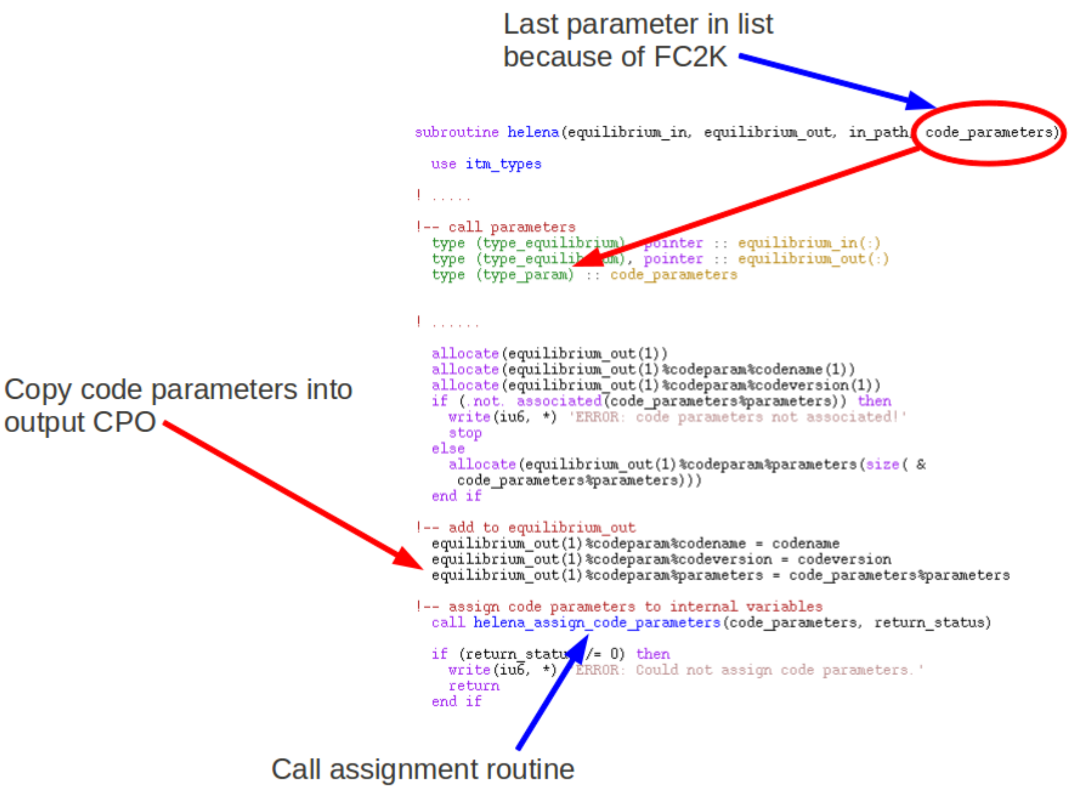
If this is not the case, you will have to edit the names in the assignment statements or calls to char2num by hand to match your internal variables.

The assignment routine receives the parameter code_parameters of type type_param which holds both the XML schema as well as the actual XML string (see above (13.6)).
It calls the ITM-TF Fortran90 Parser euitm_xml_parse on the structure code_parameters (see Fortran90 Parser (13.6.4.1)) which returns the tree of stacked code parameters from the XML schema together with the values found in the XML string as a single connected list in parameter_list . The remaining loop together with the select structure then steps through the tree and assigns all values which it finds to the corresponding internal variables.

assign_code_parameters:

- sets pointer to head of list `parameter_list%first`
- assigns values to in-code variables by stepping through the tree and using select case constructs and the interfaces in `string_manipulation_tools.f90`
- finally destroys the tree

The figure below demonstrates how to call the assignment routine from your module.



Make sure that the assignment subroutine can access the required internal variables through use statements or other ways.

`assign_code_parameters` uses the ITM standard `itm_types` for its variable declarations.

13.6.6.2 C/C++

Development of the tool for C/C++ is still pending.

13.6.6.3 Validating your XML

To validate your XML and XSD files, you may use xmlstar (path: $SWITMDIR/xmlstar/bin/):
usage:

```
xml val -w file.xml
```

or

```
xml val -s file.xsd file.xml
```

The first validates an XML file (could also be a schema) and is very useful for detecting syntactic errors. The second validates the schema (file.xsd) and the XML file (file.xml) against the schema.

13.6.7 Developments from January 2013

13.6.7.1 Creating default XML

The data going into the actor has to be stored in an xml-file that follows the data-structure defined by the xml-schema. An automated way to generate this xml file can be stored in the directory `xmllib/branches/toolbox/xml_generato` . Generate the xml-file place a schema in `xmllib/branches/toolbox/xml_generator/input` and then run `make` in `xmllib/branches/toolbox/xml_generator/obj/` . The output xml-file will then be generated in the directory `xmllib/branches/toolbox/xml_generator/output/` .

13.6.7.2 Creating XML and parameter-list.txt from namelists

Under Construction

To generate the xml and the parameter-list.txt first check out project `xmllib`

```
svn co https://gforge6.eufus.eu/svn/xmllib xmllib
```

The conversion is done by first placing the namelist in the directory `xmllib/branches/toolbox/namelists/input/` . Then run `make` in the directory `xmllib/branches/toolbox/namelists/` .

13.6.7.3 Automated creation of XML/XSD/assign_codeparam.f90

An automated proceedure has been installed to generate all files needed to install code-parameters in a Fortran code. The procedure require that you first put you file `parameter_list.txt` in the directory `xmllib/branches/toolbox/scl` and then type `make` in the directory `xmllib/branches/toolbox/` . All output file are then stored in `xmllib/branches/tool` .

13.6.8 Resources

13.6.8.1 Online

- **XML.com**
  The web site http://www.xml.com [1168] is one of the most complete and timely sources of XML information and news around.
- **XML.org**
  Sponsored by OASIS, http://www.xml.org [1169] has XML news and resources, including the XML Catalog, a guide to XML products and services.
- **DocBook**
  OASIS, the maintainers of DocBook, have a web page devoted to the XML application at http://www.docbook.org [1170].
- **W3C**
  The World Wide Web Consortium at http://www.w3.org [1171] oversees the specifications and guidelines for the technology of the World Wide Web. Check here for information about CSS, DOM, (X)HTML, MathML, XLinks, XML, XPath, XPointer, XSL, and other web technologies.
